5. EQUIPMENT UNDER TEST

5.1. DESCRIPTION OF EUT

The EUT is a close-coupled 5.8 GHz charger pad.

The charger pad is a single client RF near-field, contact charger that operates when a receiving device is placed on the charger pad's surface.

GENERAL INFORMATION

Power Requirements	100-240 VAC / 50-60 Hz / 300 mA
List of frequencies generated or used by the EUT	10 MHz, 24 MHz, 5862.5 MHz
Chassis Material	Base Bottom and Heatsink: Aluminum Base Top: Polycarbonate Plastic Cap: Polycarbonate

SUBASSEMBLIES

The EUT was constructed using the following subassemblies:

Subassembly Description	Manufacturer	Part Number
Base Bottom & Heatsink	Energous	N/A
Base Top	Energous	N/A
Plastic Cap	Energous	N/A
Antenna PCB	Energous	N/A
Main PCB	Energous	N/A
AC Adapter	Zeskit	AD566

5.2. SOFTWARE AND FIRMWARE

The firmware installed in the EUT during testing was r4254_etxnf_2.1.1.

5.3. CONFIGURATIONS INVESTIGATED

SPEAG precision low dielectric and low permittivity foam spacer material is used to vary the gap between the Charger Pad and the Load. These spacers are designed for SAR measurements and have a thickness accuracy of 0.1 mm. For test purposes the Plastic Cap was removed and the SPEAG spacers were used to adjust the gap in a repeatable manner.

Maximum power transference occurs when there is no gap. Minimum power transference occurs when there is a maximum gap. Maximum leakage is expected to occur when the magnetic switch is artificially activated with no load.

Tests were performed over a larger range of gaps than will occur during normal use, yielding worst-case results based on configurations that are more extreme than normal operation. The z-direction gap between the TX and RX antenna PCBs ranged from zero to 2 mm. At a spacing of 3 mm the RX magnet was not close enough to energize the device. A larger z-direction gap was simulated by artificially activating the magnet switch with no load.

Configuration	Description
No Load with Magnet	Load was removed. Magnet was placed on the EUT to activate the device
Load with 0 mm Spacing	Load was placed directly on the EUT TX antenna PCB
Load with 2 mm Spacing	Load was placed on the EUT TX antenna PCB with 2 mm foam in between

5.4. MODIFICATIONS

No modifications were made during testing.

7.3. RADIATED EMISSIONS

LIMIT

§18.305 (b) The field strength levels of emissions which lie outside the bands specified in §18.301, unless otherwise indicated, shall not exceed the following:

Equipment	Operating frequency	RF Power generated by equipment (watts)	Field strength limit (uV/m)	Distance (meters)
Any type unless otherwise specified (miscellaneous)	Any ISM frequency	Below 500 500 or more	25 25×SQRT (power/500)	300 ¹ 300

¹Field strength may not exceed 10 µV/m at 1600 meters. Consumer equipment operating below 1000 MHz is not permitted the increase in field strength otherwise permitted here for power over 500 watts.

The RF Power generated by the equipment is below 500 W therefore the field strength limit is 25 V/m at 300 m.

TEST PROCEDURE

7.4. AC MAINS LINE CONDUCTED EMISSIONS

LIMIT

§ 18.307 For the following equipment, when designed to be connected to the public utility (AC) power line the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies shall not exceed the limits in the following table. Compliance with the provisions of this paragraph shall be based on the measurements of the radio frequency voltage between each power line and ground at the power terminal using a 50 μ H/50 ohms line impedance stabilization network (LISN).

§ 18.307 (b) All other Part 18 consumer devices:

Frequency range (MHz)	Limits (dB μ V)	
	Quasi-peak	Average
0.15 to 0.50	66 to 56*	56 to 46*
0.50 to 5	56	46
5 to 30	60	50

* Decreases with the logarithm of the frequency.
