

1、FHSS comments

A frequency hopping spread spectrum (FHSS) system works by hopping from one frequency channel to another in all the channel lists (as listed).

The system frequency hops in all 78 channels. (2403~2480)

(A)

When in the period of building the connection, Dongle send the connection symbol (a transmitting signal) to the Device. Device is onto a certain channel (a random one) waits to receive. Dongle hops from the selected 15 channels, sending the transmitting symbol, until the Device receive the signal to get connection built.

(B)

When the connection is built, the system is still always hopping. The device and the dongle will be hopping as a same rule in each side. It will be hopping from the selected another 63 channels. Once if there is a channel or some channels are poor or noisy, as the system is always be hopping, it can easily ensure the RF connection will be stable. The sequential hops is no any order can follow, is completely random.

(C) EUT Pseudorandom Frequency Hopping Sequence

Pseudorandom Frequency Hopping Sequence Table as below:

Channel: 60, 76, 13, 03, 11, 35, 43, 37, 45, 69, 77,55, 71, 08, 24, 40, 56, 40, 48, 72, 01, 25, 33, 12, 28, 44, 60, 42, 58, 74, 11, 05,13, 37, 45 etc.
