3. TEST TYPES AND RESULTS

3.1 OCCUPIED BANDWIDTH

3.1.1 LIMIT OF OCCUPIED BANDWIDTH

The OBW is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission.

3.1.2 TEST PROCEDURES

FOR 99 PERCENT OCCUPIED BANDWIDTH

1. Set center frequency to the nominal EUT channel center frequency.
2. Set span = 1.5 times to 5.0 times the OBW.
3. Set RBW = 1 % to 5 % of the OBW
4. Set VBW $\geq 3 \cdot$ RBW
5. Video averaging is not permitted. Where practical, a sample detection and single sweep mode shall be used. Otherwise, peak detection and max hold mode (until the trace stabilizes) shall be used.
6. Use the 99 % power bandwidth function of the instrument (if available).
7. If the instrument does not have a 99 % power bandwidth function, the trace data points are recovered and directly summed in power units. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5 % of the total is reached; that frequency is recorded as the lower frequency. The process is repeated until 99.5 % of the total is reached; that frequency is recorded as the upper frequency. The 99% occupied bandwidth is the difference between these two frequencies.

FOR 26dB BANDWIDTH

1. Set center frequency to the nominal EUT channel center frequency.
2. The span range for the spectrum analyzer shall be wide enough to see sufficient roll off of the signal to make the measurement.
3. Set RBW = 1 % to 5 % of the OBW
4. Set VBW $\geq 3 \cdot$ RBW
5. Detector = Peak.
6. Trace mode = max hold.
7. Measure the maximum width of the emission that is 26 dB down from the peak of the emission.

3.2.2 TEST PROCEDURES

According to requirements of 511808 D01 C-V2X Waiver v01r01, OBU Transmit Power Test Procedures :

- The on-board unit (OBU) EIRP shall not exceed the limits provided in the relevant waiver grant. The EIRP may be calculated from the conducted measurement using antenna test data or the antenna data sheet; however, the antenna data must have sufficient resolution to determine the EIRP in the waiver grant-provided elevation from the horizontal plane.
- Radiated emission measurements are necessary if there is not sufficient resolution in antenna data to determine compliance. The general test setup is shown in Figure 1. The OBU transmit antenna shall be placed at an elevation of 1.5 meters and oriented such that the main lobe of the antenna is facing parallel to the ground plane. The OBU shall also be configured for testing in a manner that is representative of the actual installation.
- The measurement antenna may be placed at any test distance provided that it is in the far field of the OBU transmit antenna and at least 3 meters away.

Figure 1. C-V2X OBU Radiated Test Setup Diagram

d. An investigation shall be performed to ensure that the peak antenna gain is being measured. Once determined, the main lobe of the receive measurement antenna shall be configured such that it is boresight or coincident to the main lobe of the transmit antenna.

e. After the peak EIRP is measured, the receive measurement antenna shall be elevated to the appropriate height as provided in the waiver grant relative to the transmit antenna.³ The measurement antenna shall also be rotated up or down such that the transmit antenna remains in the main lobe of the measurement antenna.

3.2.3 TEST SETUP

For the actual test configuration, please refer to the attached file (Test Setup Photo).

3.3 EMISSIONS MASK

3.3.1 LIMITS

C-V2X Out-of-Band Emissions (OOBE) Limits

Frequency Offset (MHz from Channel Edge)	OOBE EIRP Limits for C-V2X Transmissions (dBm/100 kHz)**
0.0	-16.0
1.0	-22.0
10.0	-30.0

3.3.2 TEST PROCEDURE

According to requirements 511808 D01 C-V2X Waiver v01r01, An illustration of an emissions mask that may be applicable to RSUs and OBUs can be found in Figure 2.

a) Mask Test Procedure

1. Connect output of the antenna port to a spectrum analyzer or EMI receiver, with appropriate attenuation, as to not damage the instrumentation.
2. Set the reference level of the measuring equipment in accordance with the general procedures in section 4.2.3 of ANSI C63.26 - 2016.
3. Measure the power spectral density of the OOBE using the following procedure:
4. Set instrument center frequency to the frequency of channel being measured.
5. Set the span to at least 4 times the OBW.
6. Set resolution bandwidth (RBW) = 100 kHz.
7. Set video bandwidth (VBW) $\geq 3 \times$ RBW
8. Number of points in sweep $\geq [2 \times \text{span} / \text{RBW}]$.
9. Sweep time = auto.
10. Detector = power averaging (rms)
11. Trace mode = max hold.
12. Allow trace to fully stabilize.
13. In the case of devices which use multiple-input multiple-output (MIMO) technology, please follow the guidance in 662911 D01 Multiple Transmitter Output v02r01 E) 2) methods a) or c).
14. Use the instrumentation correction factors to account for cable loss and antenna gain since the final result is PSD EIRP. In the case of MIMO devices, please follow the guidance of 662911 D03 MIMO Antenna Gain Measurement v01 in determining aggregate antenna gain.

Figure 2. Emissions Mask

b) Keep in mind, the out-of-band emissions mask is based upon an absolute EIRP value in dBm/100 kHz and not a relative change in amplitude (dBr). Using the measuring equipment limit line function, develop the out-of-band emissions mask based on the emissions limits at the frequency offsets specified in the relevant waiver grant. For example, Figure 2 illustrates the emissions mask for the emissions levels at the frequency offsets described below:

1. +f1 and -f1 is the frequencies at the channel edge with an emissions level of -16 dBm/100 kHz.
2. +f2 and -f2 is a frequency offset of 1 MHz from the channel edge with an emissions level of -22 dBm/100 kHz.
3. +f3 and -f3 is a frequency offset of 10 MHz from the channel edge with an emissions level of -30 dBm/100 kHz.
4. +f4 and -f4 is a frequency offset of 20 MHz from the channel edge with an emissions level of -40 dBm/100 kHz.
