# 1. GENERAL INFORMATION

#### 1.1 PRODUCT DESCRIPTION

A major technical description of EUT is described as following:

	1			
Product Designation:	Mobile phone			
Hardware version:	SC6531_BAR_S560			
Software version:	MOCOR_12C.W13.04.14_Release			
Frequency Bands:	☐ GSM 850 ☐ PCS 1900 (U.S. Bands) ☐ GSM 900 ☐ DCS 1800 (Non-U.S. Bands) U.S. Bands: ☐ UMTS FDD Band II ☐ UMTS FDD Band V Non-U.S. Bands: ☐ UMTS FDD Band I ☐ UMTS FDD Band VIII			
Antenna:	PIFA Antenna			
Antenna gain:	1.0 dBi			
Supported mode:	2G:GSM Voice for GSM850,EGSM900,DCS1800 and PCS1900,GPRS Level: class 12;			
Hot-spot	Not support			
Power Supply:	DC 3.7V by battery			
Battery parameter:	DC 3.7V,500mAh			
Adapter Input:	100-240V~,50/60 Hz			
Adapter Output:	5.0V <del></del> ,1000mA			
GPRS Class	Multi-Class12 Only 4 timeslots are used for GPRS			
SIM CARD	The Phone has dual SIM Card sockets but only one of the dual SIM Card can be transmitting when the two SIM Cards are inserting the phone together			
Extreme Vol. Limits:	DC3.5 V to 4.2 V (Nominal DC3.7 V)			
Extreme Temp. Tolerance	-10℃ to +50℃			
** Note: The High Voltage	e 4.2V and Low Voltage 3.5V was declared by manufacturer, The EUT			

couldn't be operate normally with higher or lower voltage.

1.2 RELATED SUBMITTAL(S) / GRANT (S)

This submittal(s) (test report) is intended for **FCC ID: 2AEJAGOLM6** filing to comply with the FCC Part 22H&24E.

Report No.: NTEK-2015NT09242741F4

#### 1.3 TEST METHODOLOGY

The radiated emission testing was performed according to the procedures of TIA/EIA 603D and FCC CFR 47 Rules of 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, 2.1055, 2.1057.

#### 1.4 TEST FACILITY

The test site used to collect the radiated data is located at:

NTEK Testing Technology Co., Ltd.

1/F, Building E, Fenda Science Park, Sanwei Community, Xixiang Street, Bao'an District, Shenzhen P.R. China.

FCC Registration No.:238937; IC Registration No.:9270A-1; CNAS Registration No.:L5516

#### 1.6 SPECIAL ACCESSORIES

The battery and the charger, earphone supplied by the applicant were used as accessories and being tested with EUT intended for FCC grant together.

#### 1.7 EQUIPMENT MODIFICATIONS

Not available for this EUT intended for grant.

#### 2. SYSTEM TEST CONFIGURATION

#### 2.1 EUT CONFIGURATION

The EUT configuration for testing is installed on RF field strength measurement to meet the Commission's requirement and operating in a manner which intends to maximize its emission characteristics in a continuous normal application.

#### 2.2 EUT EXERCISE

The Transmitter was operated in the maximum output power mode through Communication Tester. The TX frequency was fixed which was for the purpose of the measurements.

#### 2.3 GENERAL TECHNICAL REQUIREMENTS

Item Number	Item Description		FCC Rules
1	Output	Conducted output power	22 012(a) / 24 222 (b)
ı	Power	Radiated output power	22.913(a) / 24.232 (b)
	Spurious	Conducted	
2	Spurious Emission	spurious emission	2.1051 / 22.917 / 24.238
	Emission	Radiated spurious emission	
3	Frequency Stability		2.1055 /24.235
4	Occupied Ba	andwidth	2.1049 (h)(i)
5	Emission Bandwidth		22.917(b) / 24.238 (b)
6	Band Edge		22.917(b) / 24.238 (b)
7	Peak-to-Average Ratio		24.232(d)

**NOTE:** use the "fully-charged battery" during the test.

#### 2.4 MEASUREMENT UNCERTAINTY

The reported uncertainty of measurement  $y \pm U$ , where expended uncertainty U is based on a standard uncertainty multiplied by a coverage factor of k=2, providing a level of confidence of approximately 95 %.

No.	Item	Uncertainty
1	Conducted Emission Test	±1.38dB
2	RF power,conducted	±0.16dB
3	Spurious emissions, conducted	±0.21dB
4	All emissions,radiated(<1G)	±4.68dB
5	All emissions,radiated(>1G)	±4.89dB
6	Temperature	±0.5°C
7	Humidity	±2%

#### 2.5 CONFIGURATION OF EUT SYSTEM

Fig. 2-1 Configuration of EUT System

Report No.: NTEK-2015NT09242741F4

7	Peak-to-Ave	rage Ratio	24.232(d)	Pass

#### 4. DESCRIPTION OF TEST MODES

During the testing, the EUT was controlled via Rhode & Schwarz Digital Radio Communication Tester (CMU 200) to ensure max power transmission and proper modulation. Three channels (The top channel, the middle channel and the bottom channel) were chosen for testing on both GPRS850 and GPRS1900 frequency band.

**Note:** GSM/GPRS 850, GSM/GPRS 1900 have been tested during the test. the worst condition (GSM850, GSM1900) be recorded in the test report if no other modes test data.

# **5. OUTPUT POWER**

# **5.1 Conducted Output Power**

#### **5.1.1 MEASUREMENT METHOD**

The EUT was setup for the max output power with pseudo random data modulation. Power was measured with Spectrum Analyzer. The measurements were performed on all modes(GSM/GPRS 850, GSM/GPRS 1900) at 3 typical channels(the Top Channel, the Middle Channel and the Bottom Channel) for each band.

#### **5.1.2 TEST SETUP**

Note: Measurement setup for testing on Antenna connector

# **5.2 Radiated Output Power**

#### **5.2.1 MEASUREMENT METHOD**

The measurements procedures specified in TIA-603D-2004 were applied.

- In an anechoic antenna test chamber, a half-wave dipole antenna for the frequency band of interest is placed at the reference centre of the chamber. An RF Signal source for the frequency band of interest is connected to the dipole with a cable that has been constructed to not interfere with the radiation pattern of the antenna. A known (measured) power (Pin) is applied to the input of the dipole, and the power received (Pr) at the chamber's probe antenna is recorded.
- The substitution method is used. Substitution values at each frequency are measured before and saved to the test software. A "reference path loss" is established as ARpl=Pin + 2.15 Pr. The ARpl is the attenuation of "reference path loss", and including the gain of receive antenna, the cable loss and the air loss. The measurement results are obtained as described below: Power=PMea+ARpl
- 3 The EUT is substituted for the dipole at the reference centre of the chamber and a scan is performed to obtain the radiation pattern.
- 4 From the radiation pattern, the co-ordinates where the maximum antenna gain occurs are identified.
- 5 The EUT is then put into continuously transmitting mode at its maximum power level.
- Power mode measurements are performed with the receiving antenna placed at the coordinates determined in Step 3 to determine the output power as defined in Rule 24.232 (b) and (c). The "reference path loss" from Step1 is added to this result.
- This value is EIRP since the measurement is calibrated using a half-wave dipole antenna of known gain (2.15 dBi) and known input power (Pin).
- 8 ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP -2.15dBi..
- 9. Both horizontal and vertical antenna polarities were tested and performed pretest to three orthogonal axis. The worst case emissions were reported

#### **5.2.2 PROVISIONS APPLICABLE**

This is the test for the maximum radiated power from the EUT. Rule Part 24.232(b) specifies, "Mobile/portable stations are limited to 2 watts e.i.r.p. Peak power" and 24.232(c) specifies that "Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage." Rule Part 22.913(a) specifies "Maximum ERP. The effective radiated power (ERP) of base transmitters and cellular repeaters must not exceed 500 Watts. The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts."

Mode	Nominal Peak Power
GSM 850	<=38.45 dBm (7W)
PCS 1900	<=33 dBm (2W)

NOTE 1: in the part, result the worst case GPRS 1slot for GSM 850 and PCS1900.

6. SPURIOUS EMISSION

# **6.1 CONDUCTED SPURIOUS EMISSION**

#### **6.1.1 MEASUREMENT METHOD**

The following steps outline the procedure used to measure the conducted emissions from the EUT.

- 1, Determine frequency range for measurements: From CFR 2.1057 the spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10th harmonic of the carrier frequency. For the equipment of PCS1900 band, this equates to a frequency range of 30 MHz to 19.1 GHz, data taken from 30 MHz to 20 GHz. For GSM850, data taken from 30 MHz to 9 GHz.
- 2, Determine EUT transmit frequencies: the following typical channels were chosen to conducted emissions testing.

Typical Channels for testing of GSM 850 MHz				
Channel	Frequency (MHz)			
128	824.2			
190	836.6			
251	848.8			

Typical Channels for testing of PCS 1900 MHz			
Channel	Frequency (MHz)		
512	1850.2		
661	1880.0		
810	1909.8		

#### **6.1.2 PROVISIONS APPLICABLE**

On any frequency outside frequency band of the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least 43+10Log(P) dB. For all power levels +30 dBm to 0 dBm, this becomes a constant specification limit of -13 dBm.

#### **6.1.3 MEASUREMENT RESULT**

PLEASE REFER TO: APPENDIX I TEST PLOTS FOR CONDUCTED SPURIOUS EMISSION

Note: 1. Below 30MHZ no Spurious found and The GSM modes is the worst condition.

2. As no emission found in standby or receive mode, no recording in this report.

### 6.2 Radiated Spurious Emission

#### **6.2.1 MEASUREMENT METHOD**

The measurements procedures specified in TIA-603D-2004 were used for testing. The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment. The resolution bandwidth is set 1MHz as outlined in Part 24.238. The measurements were performed on all modes(GPRS850, GPRS1900,) at 3 typical channels(the Top Channel, the Middle Channel and the Bottom Channel) for each band.Only shown the worst data.

The procedure of radiated spurious emissions is as follows:

a) Pre-calibration With pre-calibration method, the Radiated Spurious Emissions(RSE) is calculated as, RSE=Rx(dBuV)+CL(dB)+SA(dB)+Gain(dBi)-107(dBuV to dBm)The SA is calibrated using following setup.

b) EUT was placed on a 0.8 meter high non-conductive stand at a 3 meter test distance from the receive antenna. A receiving antenna was placed on the antenna mast 3 meters from the test item for emission measurements. The height of receiving antenna is 0.8m. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the test item and adjusting the receiving antenna polarization. The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 10th harmonic were measured with peak detector and 1MHz bandwidth.

Radiated emissions measurements were made only at the upper, middle, and lower carrier frequencies of the PCS 1900 band (1850.2 MHz, 1880 MHz and 1909.8 MHz) ,GSM850 band (824.2MHz, 836.6MHz, 848.8MHz). It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of any band into any of the other blocks.

The substitution method is used. Substitution values at each frequency are measured before and saved to the test software. A "reference path loss" is established and the A<sub>Rpl</sub> is the attenuation of "reference path loss", and including the gain of receive antenna, the gain of the preamplifier, the cable loss and the air loss. The measurement results are obtained as described below: Power=P<sub>Mea</sub>+A<sub>Rpl</sub>

#### **6.2.2 PROVISIONS APPLICABLE**

(a) On any frequency outside a licensee's frequency block (e.g. A, D, B, etc.) within the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least 43+10Log(P) dB. The specification that emissions shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB, which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

#### Note:

- 1. EUT Pre-scan X/Y/Z orientation, only worst case is presented in the report (Z orientation).
- 2. only result the worst condition of each test mode:

**Note:** Below 30MHZ no Spurious found.

#### 7. FREQUENCY STABILITY

#### 7.1 MEASUREMENT METHOD

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the EUT in a "call mode". This is accomplished with the use of R&S CMU200 DIGITAL RADIO COMMUNICATION TESTER.

- 1 , Measure the carrier frequency at room temperature.
- Subject the EUT to overnight soak at -10℃.
- 3 , With the EUT, powered via nominal voltage, connected to the CMU200 and in a simulated call on channel 661 for PCS 1900 band , channel 190 for GSM 850 band measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
- 4 , Repeat the above measurements at  $10^{\circ}$ C increments from -10°C to +50°C. Allow at least 1 1/2 hours at each temperature, unpowered, before making measurements.
- 5 , Re-measure carrier frequency at room temperature with nominal voltage. Vary supply voltage from minimum voltage to maximum voltage, in 0.1Volt increments re-measuring carrier frequency at each voltage. Pause at nominal voltage for 1 1/2 hours unpowered, to allow any self-heating to stabilize, before continuing.
- 6 , Subject the EUT to overnight soak at +50℃.
- 7 , With the EUT, powered via nominal voltage, connected to the CMU200 and in a simulated call on the centre channel, measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
- 8 , Repeat the above measurements at  $10^{\circ}$ C increments from +50°C to -10°C. Allow at least 1 1/2 hours at each temperature, unpowered, before making measurements.
- 9 , At all temperature levels hold the temperature to +/-  $0.5^{\circ}$ C during the measurement procedure.

#### 7.2 PROVISIONS APPLICABLE

# 7.2.1 For Hand carried battery powered equipment

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. As this transceiver is considered "Hand carried, battery powered equipment" Section 2.1055(d)(2) applies. This requires that the lower voltage for frequency stability testing be specified by the manufacturer. This transceiver is specified to operate with an input voltage of between 3.5VDC and 4.2VDC, with a nominal voltage of 3.7VDC. Operation above or below these voltage limits is prohibited by transceiver software in order to prevent improper operation as well as to protect components from overstress. These voltages represent a tolerance of -10 % and +12.5 %. For the purposes of measuring frequency stability these voltage limits are to be used.

#### 7.2.2 For equipment powered by primary supply voltage

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. For this EUT section 2.1055(d)(1) applies. This requires varying primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment, the normal environment temperature is 20°C.

40	16	0.019			
50	22	0.026			

Note: The EUT doesn't work below -10°C

8. BANDWIDTH

#### **8.1APPLICABLE STANDARD**

FCC §2.1049, §22.917, §22.905 and §24.238.

#### **8.2 Test Procedure**

- 1. The EUT was connected to Spectrum Analyzer and Base Station via power divider.
- 2. The 99% and 26 dB occupied bandwidth (BW) of the middle channel for the highest RF powers.
- 3. Details according with KDB 971168 section 4.1 & 4.2.

#### **Test Equipment List and Details**

Refer a test equipment and calibration data table in this test report.

#### **8.3 MEASUREMENT RESULT**

Occupied Bandwidth (99%) for GSM 850 band					
Mode	Frequency(MHz)	Occupied Bandwidth (99%)( kHz)			
Low Channel	824.2	244.391			
Middle Channel	836.6	248.716			
High Channel	848.8	239.439			

Occupied Bandwidth (99%) for PCS 1900 band						
Mode	Frequency(MHz)	Occupied Bandwidth (99%)( kHz)				
Low Channel	1850.2	242.231				
Middle Channel	1880.0	232.409				
High Channel	1909.8	246.843				

Emission Bandwidth (-26dBc) for GSM 850 band					
Mode	Frequency(MHz) Emission Bandwidth (-26dBc)(				
Low Channel	824.2	317.627			
Middle Channel	836.6	314.620			
High Channel	848.8	316.925			

Page 26 of 45

Emission Bandwidth (-26dBc) for PCS 1900 band						
Mode	Frequency(MHz) Emission Bandwidth (-26dBc)(					
Low Channel	1850.2	319.343				
Middle Channel	1880.0	315.705				
High Channel	1909.8	316.237				

#### 9. BAND EDGE

#### 9.1 Applicable Standard

According to § 22.917(a), the power of any emissions outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least  $43 + 10 \log(P)$  dB.

According to \$24.238(a), the power of any emissions outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least  $43 + 10 \log(P) dB$ .

#### 9.2 Test Procedure

- 1. The EUT was connected to Spectrum Analyzer and Base Station via power divider.
- 2. The Band Edges of low and high channels for the highest RF powers were measured. Setting RBW as roughly BW/100.
- 3. Details according with KDB 971168 section 6.0.

#### **Test Equipment List and Details**

Refer a test equipment and calibration data table in this test report.

#### 9.3 MEASUREMENT RESULT

Please refers to Appendix III for compliance test plots for band edges

# 10. Peak-to-Average Ratio

#### DESCRIPTION OF THE PAR MEASUREMENT

The peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

#### 10.1 MEASURING INSTRUMENTS

See list of measuring instruments of this test report.

#### 10.2 TEST PROCEDURES

- 1. The EUT was connected to Spectrum Analyzer and Base Station via power divider.
- 2. The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement.
- 3. For GSM/EGPRS operating modes:
  - a. Set the RBW = 1MHz, VBW = 1MHz, Peak detector in spectrum analyzer.
  - b. Set EUT in maximum power output, and triggered the burst signal.
- c. Measured respectively the Peak level and Mean level, and the deviation was recorded as Peak to Average Ratio.

#### 10.3 TEST SETUP

# 10.4 TEST RESULT OF PEAK-TO-AVERAGE RATIO

TEST RESSET STITE FAIR TO TWENTOE TO THE
