Glossary DAE

Connector angle

data acquisition electronics information used in DASY system to align probe sensor X to the robot coordinate system.

Methods Applied and Interpretation of Parameters

- DC Voltage Measurement: Calibration Factor assessed for use in DASY system by comparison with a calibrated Instrument traceable to national standards. The figure given corresponds to the Iull scale range of the voltmeter in the respective range.
- Connector angle: The angle of the connector is assessed measuring the angle mechanically by a tool inserted. Uncertainty is not required.
- The following parameters as documented in the Appendix contain technical information as a result from the performance test and require no uncertainty
 - DC Voltage Measurement Linearity: Verification of the Linearity at +10% and -10% of . the nominal calibration voltage. Influence of offset voltage is included in this measurement.
 - Common mode sensitivity: Influence of a positive or negative common mode voltage on the differential measurement.
 - Channel separation: Influence of a voltage on the neighbor channels not subject to an input voltage
 - AD Converter Values with inputs shorted: Values on the internal AD converter corresponding to zero input voltage
 - Input Offset Measurement. Output voltage and statistical results over a large number of zero voltage measurements
 - Input Offset Current: Typical value for information; Maximum channel input offset current, not considering the input resistance
 - Input resistance: Typical value for information: DAE input resistance at the connector, during internal auto-zeroing and during measurement
 - Low Battery Alarm Voltage: Typical value for information. Below this voltage, a battery alarm signal is generated
 - Power consumption: Typical value for information. Supply currents in various operating modes.

Calibration Laboratory of Schmid & Partn Engineering AG 43, 8004 Zurich, Switze

Service suisse d'étalon Servizio svizzero di larr

C

Accreditation No.: SCS 0108

ed by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

Glossary: tissue simulating liquit TSL NORMX, y, z ConvF DCP CF A, B, C, D Polarization Polarization (Polarization 8

tissue simulating liquid sensitivity in rise space sensitivity in rise pace diode compression point areat factor (1/daty, cycle) of the RF signal modulation dependent linearization parameters e rotation around probe axis & rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., 9 = 0 is normal to probe axis information used in DASY system to align probe sensor X to the robot coordinate system Connector Angle

Connector Angle Information used in DASY system to any processensor X to the robot Countains system Calibration is Performed According to the Following Standards: a) IEEE Std 1526-2013, 'IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices; Measurement Techniques", June 2013 b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) form hand-held and body-mounted devices used next to the asressment of Specific Absorption Rate (SAR) form hand-held and body-mounted devices used next to the asressment of Specific Absorption Rate (SAR) form hand-held and body-mounted devices used next to the asressment of Specific Absorption Rate (SAR) for Wireless communication device used in close proximity to the human body (frequency range of 300 MHz to 6 GHz)", March 2010 d) KDB 85564, "SAR Measurement Requirements for 100 MHz to 6 GHz".

- tion devices

- Methods Applied and Interpretation of Parameters:
 NORMx, yz; Assessed for E-field polarization is = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz; R22 waveguide).

 NORMx, yz are only intermediate values, i.e., the uncertainties of NORMx, yz does not affect the E⁵-field uncertainty inside TSL (see below ConvC).
 - uncertainty inside TSL (see below ConvF). NORM(I)x,y,z = NORMx,y,z * frequency_response (see Frequency Response Chart). This linearization is implamented in DASV4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF. DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media. PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics

 - .
 - .
 - *PAR*: pAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics *Ax*, *y*, *z*; *Xx*, *y*; *Cx*, *y*; *z*, *Xx*, *X*, *B*, *G*, *D* are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. *VR* is the maximum calibration range expressed in RMS voltage across the diode. *ConvF* and Boundary *Effect Parameters*: Assessed in flat phantom using *E*-field (or Temperature Transfer Standard for *f* = 800 MHz) and inside waveguide using analytical field distributions based on power measurements for *f* > 800 MHz). The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORK*x*, *y*: *T ConvF* whereby the uncertainty corresponds to that given for *ConvF* at frequency dependent *ConvF* is used in DASY4 advarte to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORK*x*, *y*: *T ConvF* whereby the uncertainty corresponds to that given for *ConvF* at *N* frequency dependent *ConvF* is used in DASY version *4*. and higher which allows extending the validity from ± 50 MHz to ± 100 MHz. *Spharical isotrapy* (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch entenna. *Sensor Offset*: The sense required. *Connector Angle:* The angle is assessed using the information gained by determining the *NORMx* (no. uncertainty required).
