

OPERATION INSTRUCTIONS

1. Do not touch the surface of the top of the solar light with any hard objects (this could break or scratch the solar panel)
2. You can check the operation of the light by simply covering the upper surface of the solar panel. The light will be turned on automatically once the sensor detects darkness.
3. Remember that the light is designed to work when it is dark. If there's high ambient lighting, then the LED light may be very dim or might not turn on at all. This does not mean that the light does not work; it could be that the surrounding is already very bright.
4. Although the battery has been charged by the manufacturer, the electric capacity could have dropped when you received the light.
Please charge the light for a full day in order for the light to perform at its maximum ability.
