

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance  $\leq$  50 mm are determined by:

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [f(\text{GHz})] \leq 3.0$$

The tune-up power is -3dBm +/- 2dB, therefore the highest tune-up power is -2.98 dBm (0.50 mW) @ 2402 MHz

When the minimum *test separation distance* is  $<$  5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

$$(\text{0.50mW} / \text{5mm}) * (2.402\text{GHz}^{0.5}) = 0.2$$

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [f(\text{GHz})] = 0.2 < 3.0$$

Therefore, standalone SAR measurements are not required for both head and body.
