1. INTRODUCTION

This report presents the results of radio test carried out on the following radio equipment: *Wirnet iBTS 64 Highway*, in accordance with normative reference.

The device under test integrates the followings radio function:

- GPS receiver Integrated with CPU
- 3G/LTE module already certified (FCC ID:N7NMC7355). Slot 1
- LoRa function Slot 2 to 5

This test report concern MPE results.

Each slot 2 to 5 corresponds to a LoRa module and each LoRa module possesses 2 RF output.

The product can emit on a single LoRa module at 30 dBm or on 4 modules at 24 dBm.
Only one RF output is used during normal use, but both can be used.

In addition when the 4 modules are used it's impossible they emit on the same frequency

2. PRODUCT DESCRIPTION

LoRa

Frequency band used 902MHz to 928 MHz

Frequencies plan detailed (LoRaWAN standard)

Transmitter

Channel frequencies	LoRa bandwidth (kHz)	Number of channel	Channel width (kHz)	SPREAD FACTOR
923,3+i*0,6MHz (i=0 to 7)	500	8	600	7 to 12

Receiver

Channel frequencies	LoRa bandwidth (kHz)	Number of channel	Channel width (kHz)	SPREAD FACTOR
902,3+i*0,2MHz (i=0 to 63)	125	64	200	7 to 10
903,0+i*1,6MHz (i=0 to 7)	500	8	600	7 to 12

Class: B

Utilization: Residential use

Antenna type and gain: 3 dBi or 6dBi

Power source: AC/DC Midspan PoE injector 60W

Power level, frequency range and channels characteristics are not user adjustable.
The details pictures of the product and the circuit boards are joined with this file.

MC7355 module

Extract from MC7355-Module-FCC-MPE-Evaluation-v10r1-2311393

The MC7355 wireless modem can be installed for use in any mobile host as long as the antenna gain of the host antenna does not exceed the gain listed in table 2.

This MPE analysis is applicable to any collocated transmitters with transmit power:

- less than or equal to 29.0dBm for WLAN/WiMAX; and
- less than or equal to 15.0dBm for BT.

Specific FCC IDs for those devices are not necessary or identified in this analysis providing they are classified as mobile transmitters. A 100% duty cycle is used for calculations to present a worse-case analysis when applicable.

3. NORMATIVE REFERENCE

The standards and testing methods related throughout this report are those listed below. They are applied on the whole test report even though the extensions (version, date and amendment) are not repeated.

CFR 47 (2018)	Radio Frequency Devices
ANSI C63.10	2013 Procedures for Compliance Testing of Unlicensed Wireless Devices.
447498 D01 General RF Exposure Guidance v06	RF Exposure procedures and equipment authorization policies for mobile and portable equipment

4. RF EXPOSURE**Calculus for LoRa in standalone**

RF EXPOSURE: The analyze is realized only with the worst critical antenna 6 dBi

Maximum measured power = 28.35 dBm at 925.7 MHz

With a gain at 6dBi

EIRP = 34.35 dBm = 2.7227 W

The maximum duty cycle is 40% on the reference period of 6min, so the power computed is: 1089.1mW

In accordance with KDB 447498 D01 General RF Exposure Guidance v06:

$$PSD = EIRP/(4\pi R^2)$$

$$\Rightarrow 1089.1/(4\pi(20 \text{ cm})^2) = 0.217 \text{ mW/cm}^2 \text{ (limit=0.6183 mW/cm}^2)$$

The MPE ratio is then calculated for the simultaneous transmission.

$$MPE \text{ ratio(LoRa)} = \frac{PSD}{PSD \text{ lim}} = 0.351$$

The equipment fulfils the requirements on power density for general population/uncontrolled exposure and therefore fulfils the requirements of 47 CFR §1.1310.

Calculus for MC7355 in standalone

The results are extracted from MC7355-Module-FCC-MPE-Evaluation-v10r1-2311393 and calculated with the antenna used.

Calculus for simultaneous transmission

Only the worst critical case for the WAN module is taken into account for this analysis

$$\sum \text{ of MPE ratio} = \text{MPE ratio(GPRS)} + \text{MPE ratio(LoRa)} = 0.454 + 0.351 = 0.801 \leq 1.0$$

The product meet the requirement for Simultaneous transmission MPE test exclusion from §7.2 of KDB 447498
