#### **3.2. General Description**

The Equipment Under Test (EUT) BSC7048A243 is a 5G NR base station which provides communication connections to 3550-3700 MHz network. The EUT operates from a 48V DC supply.

The EUT includes 2 TX/RX ports. It can operate in NR single RAT mode. It can be configured to transmit in MIMO mode which was used for measurements as the worst configuration. The complete testing was performed with the EUT transmitting at rated maximum RF power unless otherwise stated.

A full technical description can be found in the Manufacturer's documentation.

### 3.3. Configuration Description

The following settings were used to represent all traffic scenarios. The output power was measured on the bottom, middle and top channel of both applicable antenna ports. By measuring the output power of QPSK, 64QAM and 256QAM for NR on both of the antenna ports, it was determined that QPSK was the worst case modulation scheme and was used for all testing.

Complete testing was carried out on the worst case antenna port which was established as being the highest output power from the applicable measured ports on worst case modulation scheme. This antenna port was Port 0 for NR single RAT mode.

The settings below were used for all measurements unless otherwise noted:

Carrier Bandwidth	Carrier Frequency Configuration (MHz)		
	Bottom	Middle	Top
10MHz	3555	3624.99	3694.98
20MHz	3560.01	3624.99	3690
30MHz	3565.02	3624.99	3684.99
40MHz	3570	3624.99	3679.98

## **Annex A: Measurement Results**

### **A.1 Maximum Output Power and Peak to Average Power Ratio**

#### **A.1.1 Reference**

FCC CFR 47 Part 96, Clause 96.41(b), 96.41(g)

FCC CFR 47 Part 2, Clause 2.1046

#### **A.1.2 Method of Measurements**

During the process of testing, the EUT was configured to transmit on maximum power and proper modulation. The transmitter power shall be measured in terms of a root-mean-square (RMS) average value. In case of the EUT was configured to MIMO mode, since the EUT transmits on all antennas simultaneously in the same frequency range, using the Measure-and-Sum approach, spectra are measured at each output of the EUT at the required resolution bandwidth. The individual spectra are then summed mathematically in linear power units according to FCC KDB 662911 D01.

A peak to average ratio measurement is performed at the conducted ports of the EUT for single carrier for single RAT mode. The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) was used and 0.1% probability value recorded.

The antenna gain is declared as 13dBi, therefore the EIRP is calculated as the sum of the power over 2 ports plus the antenna gain.

#### **A.1.3 Limit**

Maximum EIRP:  $\leq 47\text{dBm}/10\text{MHz}$

Maximum PSD:  $\leq 37\text{dBm}/\text{MHz}$

PAPR:  $\leq 13\text{dB}$

## **A.2 Occupied Bandwidth**

### **A.2.1 Reference**

FCC CFR 47 Part 96, Clause 96.41(e)

FCC CFR 47 Part 2, Clause 2.1049

### **A.2.2 Method of Measurements**

The EUT was set to transmit at maximum power and testing was carried out on bottom, middle and top channels. Using the Occupied Bandwidth measurement function in the spectrum analyzer, the 26dB bandwidth was measured in accordance with ANSI 63.26.

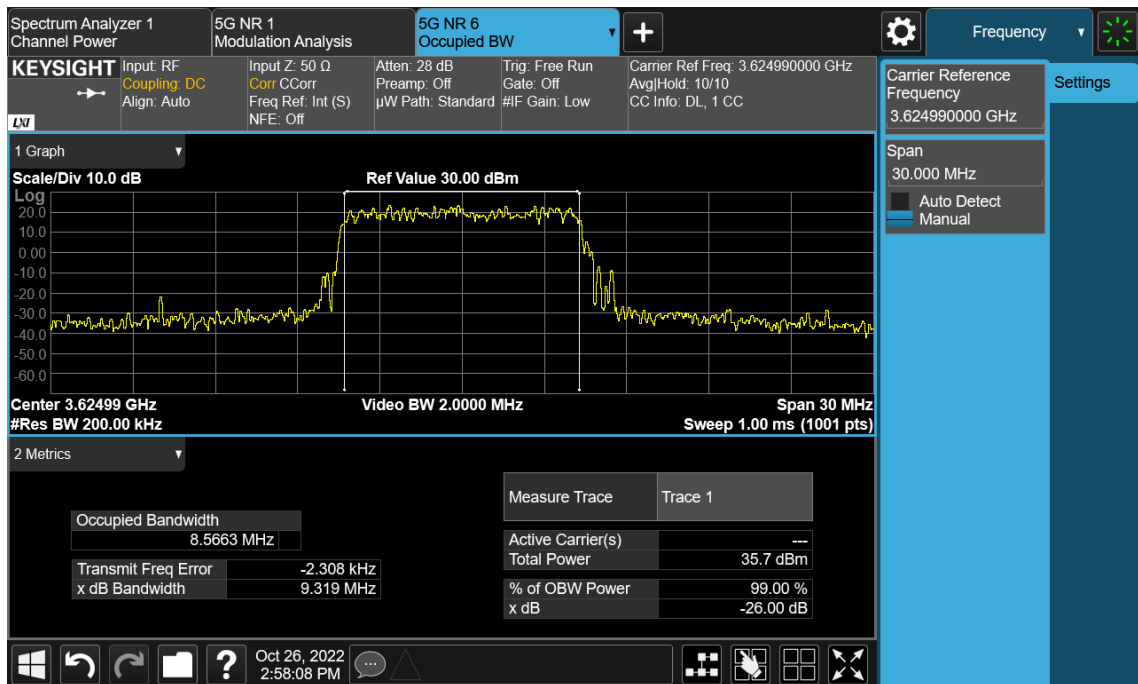

The measurement method is from ANSI 63.26:

- a) The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be set wide enough to capture all modulation products including the emission skirts (i.e., two to five times the OBW).
- b) The nominal IF filter bandwidth (3 dB RBW) shall be in the range of 1 to 5 % of the anticipated OBW, and the VBW shall be at least 3 times the RBW.
- c) Set the reference level of the instrument as required to keep the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope must be at least  $10\log(\text{OBW} / \text{RBW})$  below the reference level.
- d) Set the detection mode to peak, and the trace mode to max hold.
- e) Use the 99 % power bandwidth function of the spectrum analyzer and report the measured bandwidth.

## **A.3 Transmitter unwanted emissions at Band Edge**

### **A.3.1 Reference**

FCC CFR 47 Part 96, Clause 96.41(e)

FCC CFR 47 Part 2, Clause 2.1051

### **A.3.2 Method of measurement**

For channel and frequency assignments made by the SAS to CBSDs, the conducted power of any CBSD emission outside the fundamental emission bandwidth shall not exceed -13dBm/MHz within 0–10 megahertz above the upper SAS-assigned channel edge and within 0–10 megahertz below the lower SAS-assigned channel edge. At all frequencies greater than 10 megahertz above the upper SAS assigned channel edge and less than 10 MHz below the lower SAS assigned channel edge, the conducted power of any CBSD emission shall not exceed -25 dBm/MHz. The conducted power of emissions below 3540 MHz or above 3710 MHz shall not exceed -25dBm/MHz, and the conducted power of emissions below 3530 MHz or above 3720 MHz shall not exceed -40dBm/MHz.

In the 1 megahertz bands immediately outside and adjacent to the licensee's authorized frequency channel, a resolution bandwidth of no less than one percent of the fundamental emission bandwidth may be employed.

### **A.3.3 Measurement limit**

0-10MHz from channel edge:  $\leq -13\text{dBm/MHz}$

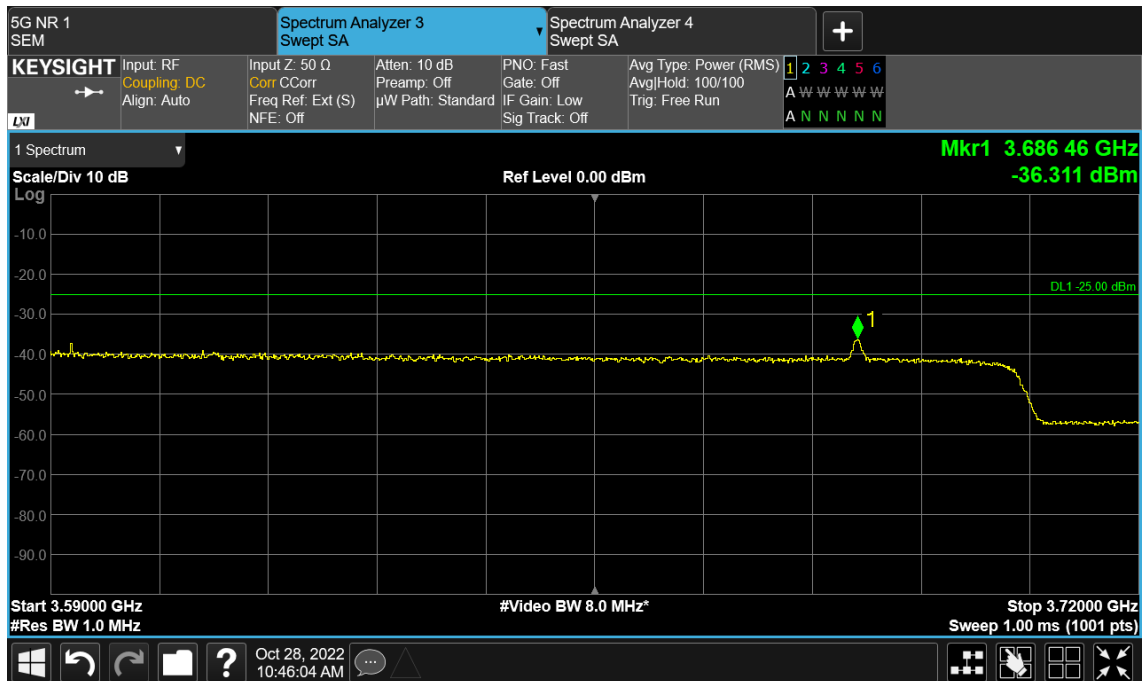

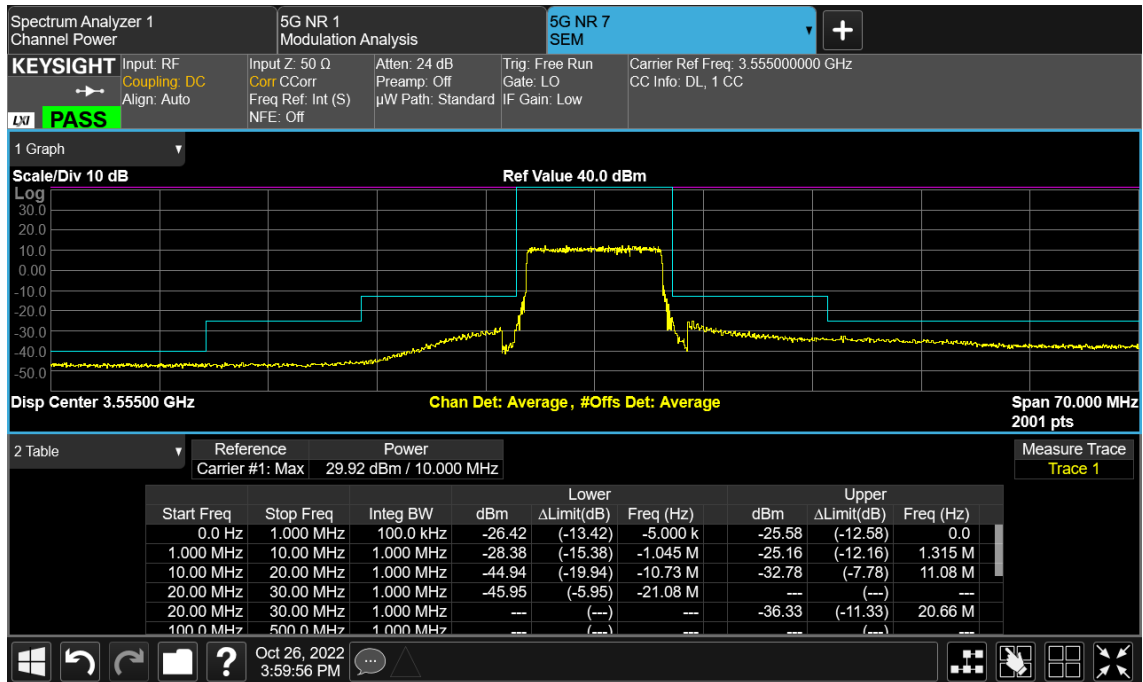

>10MHz from channel edge:  $\leq -25\text{dBm/MHz}$

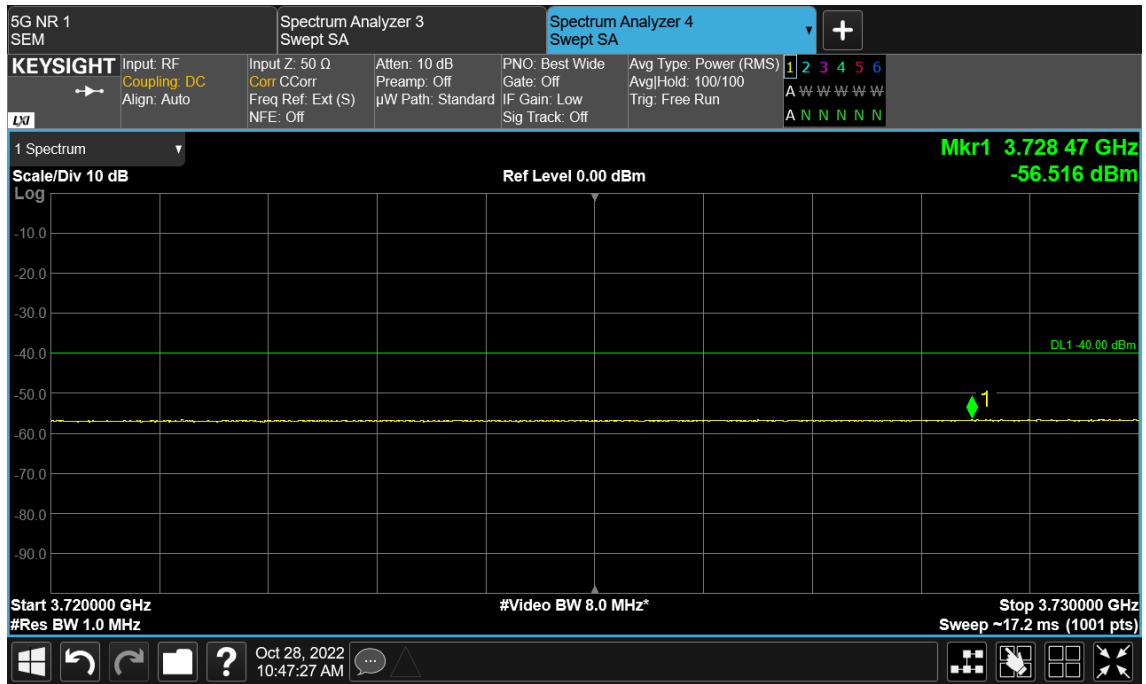

3530MHz-3540MHz and 3710MHz-3720MHz:  $\leq -25\text{dBm/MHz}$

below 3530 MHz and above 3720 MHz:  $\leq -40\text{dBm/MHz}$
