5 General Information

5.1 General Description of E.U.T.

Product:	LTE-TDD Base Station
Model(s):	mBS2130
Model Description:	N/A
Storage Location:	Internal Storage
Note:	N/A

5.2 Details of E.U.T.

Operation Frequency:	3655MHz~3695MHz
Type of Modulation:	QPSK, 16QAM, 64QAM
Antenna installation:	External antenna
Antenna Gain:	3.0dBi
Ratings:	DC 48V
Number of transmitter chains:	2Tx*2Rx (MIMO)*2

For the purpose of increasing capacity and DL/UL throughput, This outdoor TDD base station has 2 cells within one eNB, which means 2 carriers(Master and Slave) are configured correspondingly. Under such circumstance, the deployment of antenna and relative center frequency setting must be taken into account carefully in order to avoid interference from opposite cell.

This device support 2*MIMO(2Tx*2Rx) transmission mode 3 per carrier as defined in the 3GPP specification with two transmission antennas. The MIMO scheme is open loop transmission and the signals are uncorrelated transmitted in multiple channels in a single frequency band. Carrier Aggregation is not supported and no additional requirement for directional gain calculations based on supported operating modes.

Directional gain =GANT + 10 log (ANT_N) dBi

Test Method:	FCC part2.1046 ANSI C63.26-2015
Test Mode:	Data communicating mode
Limit:	FCC: (a) Base and fixed stations are limited to 25 watts/25 MHz equivalent isotropically radiated power (EIRP). In any event, the peak EIRP powerdensity shall not exceed 1 Watt in any one-megahertz slice of spectrum. (b) In addition to the provisions in paragraph (a) of this section, transmitters operating in the 3650-3700 MHz band that emit multipledirectional beams, simultaneously or sequentially, for the purpose of directing signals to individual receivers or to groups of receivers provided theemissions comply with the following: (1) Different information must be transmitted to each receiver. (2) If the transmitter employs an antenna system that emits multiple directional beams but does not emit multiple directional beamssimultaneously, the total output power conducted to the array or arrays that comprise the device, <i>i.e.</i> , the sum of the power supplied to allantennas, antenna elements, staves, etc. and summed across all carriers or frequency channels, shall not exceed the limit specified in paragraph(a) of this section, as applicable. The directional antenna gain shall be computed as follows: (i) The directional gain, in dBi, shall be calculated as the sum of 10 log (number of array elements or staves) plus the directional gain, in dBi,of the individual element or stave having the highest gain. (ii) A lower value for the directional gain than that calculated in paragraph (b)(2)(i) of this section will be accepted if sufficient evidence ispresented, <i>e.g.</i> , due to shading of the array or coherence loss in the beam-forming. (3) If a transmitter employs an antenna that operates simultaneously on multiple directional beams using the same or different frequencychannels and if transmitted beams overlap, the power shall be reduced to ensure that the aggregate power from the overlapping beams does notexceed the limit specified in paragraph (b)(2) of this section. In addition, the aggregate power transmitted simultaneously on all beams shall notexceed the limit specified in paragraph (b)(2) of this section by more than 8 dB. (4) Transmitters that emit a single directional beam shall operate under the provisions of paragraph (b)(2) of this section.

Test Requirement:	FCC part 90.210(b)
Test Mode:	Data communicating mode
Limit:	Emission Mask B. For transmitters that are equipped with an audio low-pass filter, the power of any emission must be attenuated below the unmodulated carrier power (P) as follows: (1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25 dB. (2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: At least 35 dB. (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least $43 + 10 \log (P)$ dB

10.1 EUT Operation

Operating Environment :	
Temperature:	22.5 °C
Humidity:	52.3% RH
Atmospheric Pressure:	101.2kPa

10.2 Test Procedure

1. The RF output of the transceiver was connected to a spectrum analyzer through appropriate attenuation.
2. RBW=100kHz, VBW=1MHz, Detector mode= RMS,
Trace mode: Power averaging over 100 sweeps

Note: For FCC part 90.210(b) 3, more than 250 percent emission was considered in radiated emission test items.
