## **INTERTEK TESTING SERVICES**

## **RF Exposure**

The equipment under test (EUT) is a Bluetooth Headphone with Bluetooth function. The EUT was powered by the fully-charged DC 3.7V, 400mAh new rechargeable battery which was charged by USB port (DC 5V). For more detail information pls. refer to the user manual.

Modulation Type: GFSK for BT 4.0 (LE) and GFSK,  $\pi/\text{4DQPSK},\,\text{8DPSK}$  for BT 2.1+EDR.

Bluetooth Version: Dual mode.

Antenna Type: Integral antenna.

Antenna Gain: 0dBi.

The nominal conducted output power specified: 6.0dBm +/-3dB.

The nominal radiated output power (e.i.r.p) specified: 6.0dBm (+/- 3dB)

## According to the KDB 447498:

The maximun peak radiated emission for the EUT is 103.3dBµV/m at 3m in the frequency 2480MHz of BT 4.0

The EIRP =  $[(FS*D) ^2 / 30]$  mW = 8.07dBm which is within the production variation.

The minimum peak radiated emission for the EUT is  $101.6dB\mu V/m$  at 3m in the frequency 2480MHz of BT 2.1+EDR The EIRP = [(FS\*D) ^2 / 30] mW = 6.37dBm which is within the production variation.

The maximun conducted output power specified is 9.0dBm = 7.9mW The source- based time-averaging conducted output power

- = 7.9 \* Duty Cycle mW (where Duty Cycle≤1)
- = 7.9 mW

The SAR Exclusion Threshold Level:

- = 3.0 \* (min. test separation distance, mm) / sqrt(freq. in GHz)
- = 3.0 \* 5 / sqrt (2.480) mW
- $= 9.5 \, \text{mW}$

Since the source-based time-averaging conducted output power is well below the SAR low threshold level, so the EUT is considered to comply with SAR requirement without testing.

FCC ID: 2AGA9RS70
