1. RF Exposure Evaluation

1.1. Limits

According to FCC 1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in 1.1307(b)

LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

| _ | Electric | Magnetic | Power | Average | | |
|--|-------------------|-------------------|---------------------|-------------------|--|--|
| Frequency Range (MHz) | Field Strength | Field Strength | Density (mW/cm2) | Time (Minutes) | | |
| (V/m) (A/m) (A/m) (A) Limits for Occupational/ Control Exposures | | | | | | |
| 300-1500 | | | F/300 | 6 | | |
| 1500-100,000 | | | 5 | 6 | | |
| (B) Limits for General Population/ Uncontrolled Exposures | | | | | | |
| 300-1500 | | | F/1500 | 6 | | |
| 1500-100,000 | | | 1 | 30 | | |

F= Frequency in MHz

Friis Formula

Friis transmission formula: $Pd = (Pout^{*}G)/(4^{*}pi^{*}r^{2})$

Where

 $Pd = power density in mW/ cm^2$

Pout = output power to antenna in mW

G = gain of antenna in linear scale

Pi = 3.1416

R = distance between observation point and center of the radiator in cm

Pd is the limit of MPE, 1 mW/cm². If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance r where the MPE limit is reached.

According to RSS 102 Issue 5: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in RSS 102 Clause 4
