1. Summary of test results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfil according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The Equipment Under Test (in this report, hereinafter referred as EUT) supports radiofrequency technologies and use an already approved cellular module with **ALS3-USR3** with **FCC-ID: QIPALS3-USR3** and **ISED: 7830A-ALS3USR3**. This test report shows results for LTE technology only. Other implemented wireless technologies were not considered within this test report.

Following tests have been performed to show compliance with applicable FCC Part 2, Part 22, Subpart H, Part 24, Subpart E (Broadband PCS) and FCC Part 27, Subpart C, of the FCC CFR Title 47 Rules, Edition 2017 and Canada RSS-132 Issue 3, RSS-133 Issue 6 and RSS-Gen Issue 5 standards.

4.2. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification: ANSI C63.4-2014 §5.3, §8.2.1, §8.3.1.1+§8.3.2.1, ANSI C63.10-2013 chapter

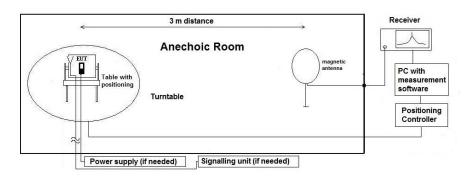

6.4 (§6.4.4.2)

General Description: Evaluating the radiated field emissions are done first by an exploratory emission

measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed in the semi anechoic room recognized by the regulatory commission.

Schematic:

Testing method:

Exploratory, preliminary measurement

The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0° to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

$$E_C = E_R + AF + C_L + D_F - G_A$$

$$M = L_T - E_C$$

Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

AF = Antenna factor

 $C_L = Cable loss$

D_F= Distance correction factor

 E_C = Electrical field – corrected value

 E_R = Receiver reading

G_A= Gain of pre-amplifier (if used)

 $L_T = Limit$ M = Margin

All units are dB-units, positive margin means value is below limit.

Distance correction:

Reference for applied correction (extrapolating) factors due to reduced

measurement distance:

ANSI C63.10:2013, $\S6.4.4.2$ - Equations (2) + (3) + (4)

4.3. Test system set-up for radiated spurious emission measurements

Specification: ANSI C63.4-2014 chapter 8.3, ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4, ANSI

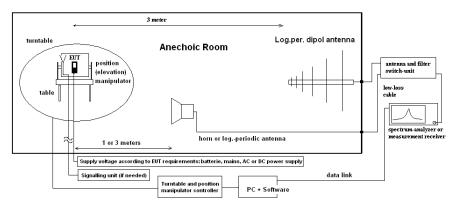

C63.26-2015, Chapter 4.6.3.3

General Description: Evaluating the emissions have to be done first by an exploratory emissions

measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements

on the EUT.

Schematic:

Testing method:

Exploratory, preliminary measurements

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.50 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 45°) and the EUT itself on 3-orthogonal axis (the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined. Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out. The readings on the spectrum analyzer are corrected with conversion value between field strength and E(I)RP, so the readings shown are equivalent to ERP/EIRP values. Critical measurements near the limit are re-measured with a substitution method accord. ANSI/TIA/EIA 603

Formula:

$$E_C = E_R + AF + C_L + D_F - G_A$$
 (1)

 $Ec_{E(DRP)} = Ec - 95.2 dB$

 $M = L_T - Ec_{E(I)RP}$

 E_C = Electrical field – corrected value

 E_R = Receiver reading

M = Margin

 $L_T = Limit$

AF = Antenna factor

 $C_L = Cable loss$

 D_F = Distance correction factor (if used)

 G_A = Gain of pre-amplifier (if used)

 $Ec_{E(I)RP}$ = Electrical field corrected for E(I)RP

All units are dB-units, positive margin means value is below limit.

5.1.3. Test condition and test set-up

Climatic conditions	Temperature: (22±3°C) Rel. humidity: (40±20)%
Test system set-up	Please see chapter "Test system set-up for conducted measurements on antenna port"
	The measurements were performed with the integrated power measurement function of the "radio communication tester CMW500 from Rohde&Schwarz company. In this way spectrum-analyzers instrument limitations can be avoided or minimized. Instead, CMW manufacturers declared measurement error can be considered for this measurement.
Measurement method	The attenuation (insertion loss) at the RF Inputs/Outputs of CMW were set according the path loss of the test set-up, determined in a step before starting the measurements. A suitable artificial antenna or RF-connector is provided by the applicant in order to perform the conducted measurements. Any data provided with the artificial antenna or connector, have been taken in account in order to correct the measurement data. (typical 0.3dB for attenuation of antenna connector)
	Peak and Average Values have been recorded for each channel and band. The Peak-to -Average-Ratio is determined by comparing the total peak power to total average power for each measurement.
	A call was established with a suitable communication test unit (CMW500). UE is set TX mode, highest transmit power conditions (RMC-mode), power saving techniques have been disabled (MPR-techniques)
Mobile phone settings	Tests have been performed in different EUT bandwidth settings and various settings for allocated RBs.
	The measurements were made at the low, middle and high carrier frequencies of each of the supported operating band within the designated range within the allowed channel bandwidths. Choosing three TX-carrier frequencies of the mobile phone, should be sufficient to demonstrate compliance.

5.2.5. Correction factors due to reduced meas. distance (f< $30\ MHz$)

The used correction factors when the measurement distance is reduced compared to regulatory measurement distance, are calculated according Extrapolation formulas valid for EUT's with maximum dimension of 0.625xLambda. Formula 2+3+4 as presented in ANSI C63.10, Chapter 6.4.4 are used for the calculations of proper extrapolation factors.

Frequency -Range	f [kHz/MHz]	Lambda [m]	Far-Field Point [m]	Distance Limit accord. 15.209 [m]		1st Condition (dmeas< D _{near-field})	2'te Condition (Limit distance bigger d _{near-field})	Distance Correction accord. Formula

	Parameter:							
Spectrum Analyzer Settings	Scan Mode RBW VBW Sweep time Sweep mode Detector	Spectrum analyser mode 1 MHz 10 MHz Coupled (Auto) repetitive Peak						
Measurer	nent method	The spectrum was scanned from 9 kHz to the 10th harmonic of the highest frequency generated within the equipment. A PEAK detector was used except measurements near the Band-Edge where a AVERAGE detector applied when results are critical (low margin or limit exceed). Tests have been performed in various settings for the device regarding allocated resource blocks and channels in orde to find worst-case configuration. Due to very big amount of possible combinations only certain combinations have been tested.						
Mobile pl	none settings	A call was established on highest power transmit conditions in RMC mode. MPR was deactivated. The measurements were made at the low, middle and high carrier frequencies of each of the supported operating band within the designated range within the allowed channel bandwidths. Choosing three TX-carrier frequencies of the mobile phone, should be sufficient to demonstrate compliance.

5.3.4. Results

The results are presented below in summary form only. For more information please see the diagrams enclosed in annex 1.(17-1-0221001T20a-C1-A1)

5.3.4.1. LTE Band 2: Op. Mode 1, Set-up 1

Diagram no.		· Channel	Frequency range	OP- mode	Remark	Use	d detec	tor	Result
	Range	No.	range	no.		PK	AV	QP	
8.01a					External_Antenna_EUT Standing Carrier visible on diagram. Not relevant for results	×			passed
8.01b	1RB	18900	30 MHz to	1	External_Antenna_EUT Laying Carrier visible on diagram. Not relevant for results	×			passed
8.05a	low	18900	18 GHz	1	Internal_Antenna_EUT Standing Carrier visible on diagram. Not relevant for results	×			passed
8.05b					Internal_Antenna_EUT Laying Carrier visible on diagram. Not relevant for results	×			passed

Remark: Used channel bandwidth of 5,0MHz mid channel_18900 was chosen as worst-case as determined within power measurements

5.3.4.1.1. Conducted Band-Edge Low: 1849-1850 MHz, 3MHz Signal BW

Diagram	Channel	Op.	Number	Modulation	Detector		Conducted value	Internal Loss	External cable loss	External Antenna	Final value	XX 11 .
No.	no.	Mode	of RBs	scheme	PK	RMS	[dBm]	[dB]	[dB]	Gain [dBi]	[dBm]	Verdict
37.203a	18615	1	■ 1RB low	☑ QPSK modulation		×	-18.0	1.2	3.0	5.5	-16.7	Pass
37.203b	18615	1	ĭ 1RB low	☑ 16- QAM modulation		×	-19.55	1.2	3.0	5.5	-20.85	Pass
37.204a	18615	1	≥ 15 RBs	☑ QPSK modulation		×	-25.03	1.2	3.0	5.5	-26.33	Pass
37.204b	18615	1	¥ 15 RBs	☑ QAM modulation		×	-26.21	1.2	3.0	5.5	-24.91	Pass

Remark: conducted value have been corrected by internal PCB path loss + cable path loss and added antenna gain for external antenna as declared by the applicant

${\bf 5.3.4.1.2.}\ \ {\bf Band\text{-}Edge\ High:\ 1910\text{-}1911MHz,\ 3MHz\ Signal\ BW}$

5.4. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor \mathbf{k} , such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Ca	Calculated uncertainty based on a confidence level of 95%				ı a	Remarks			
Conducted emissions (U CISPR)	CISPR 16-2-1	9 kHz - 150 kHz 150 kHz - 30 MHz		4.0 dB 3.6 dB					-

Table: measurement uncertainties, valid for conducted/radiated measurements

6. Abbreviations used in this report

The abbreviation	The abbreviations					
ANSI	American National Standards Institute					
AV , AVG, CAV	Average detector					
EIRP	Equivalent isotropically radiated power, determined within a separate measurement					
EGPRS	Enhanced General Packet Radio Service					
EUT	Equipment Under Test					
FCC	Federal Communications Commission, USA					
IC	Industry Canada					
n.a.	not applicable					
Op-Mode	Operating mode of the equipment					
PK	Peak					
RBW	resolution bandwidth					
RF	Radio frequency					
RSS	Radio Standards Specification, Documents from Industry Canada					
Rx	Receiver					
TCH	Traffic channel					
Tx	Transmitter					
QP	Quasi peak detector					
VBW	Video bandwidth					
ERP	Effective radiated power					

7. Accreditation details of CETECOM's laboratories and test sites

Ref No.	Accreditation Certificate	Valid for laboratory area or test site	Accreditation Body
-	D-PL- 12047-01-01	All laboratories and test sites of CETECOM GmbH, Essen	DAkkS, Deutsche Akkreditierungsstelle GmbH

Note / remarks		Calibrated during system calibration:
	1a	System CTC-SAR-EMS (RefNo. 442)
	1b	System-CTC-EMS-Conducted (RefNo. 335)
	1c	System CTC-FAR-EMI-RSE (RefNo . 443)
	1d	System CTC-SAR-EMI (RefNo . 441)
	1e	System CTC-OATS (EMI radiated) (RefNo. 337)
	1 f	System CTC-CTIA-OTA (RefNo . 420)
	1 g	System CTC-FAR-EMS (RefNo . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months, between this every 12 months internal validation
	36/12 M	Calibration every 36 months, between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	_	Without calibration

9. Versions of test reports (change history)

Version	Applied changes	Date of release
	Initial release	2018-09-28
C1	Costumer Name updated and 'End of Report' added	2019-01-02
