E[dBµV/m] = EIRP[dBm] + 95.2=105.2 dBuV/m, for EIPR[dBm]=15.6dBm. E[dBµV/m] = EIRP[dBm] + 95.2=122.2 dBuV/m, for EIPR[dBm]=27dBm.         1.       The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter camber. The table was rotated 360 degrees to determine the position of the highest radiation.         2.       The antenna height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.         4.       For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable was turned from 0 degrees to 360 degrees to find the maximum reading.         5.       The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.         6.       If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re- tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.

## 6.8 Frequency stability

Test Requirement:	FCC Part15 E Section 15.407 (g)				
Limit:	Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual.				
Test setup:	NS1228   CMW220 <pcmw220< p=""> CMW220 CMW220 <pcmw22< th=""></pcmw22<></pcmw220<>				
Test procedure:	<ol> <li>The EUT is installed in an environment test chamber with external power source.</li> <li>Set the chamber to operate at 50 centigrade and external power source to output at nominal voltage of EUT.</li> <li>A sufficient stabilization period at each temperature is used prior to each frequency measurement.</li> <li>When temperature is stabled, measure the frequency stability.</li> <li>The test shall be performed under -30 to 50 centigrade and 85 to 115 percent of the nominal voltage. Change setting of chamber and external power source to complete all conditions.</li> </ol>				
Test Instruments:	Refer to section 5.10 for details				
Test mode:	Refer to section 5.3 for details				
Test results:	Refer to Appendix A - 5.2 GHz & Appendix A - 5.8 GHz
