MPE Calculation for Bands

The safe distance where Power Density is less than the MPE limit listed above was found to be 20 cm.

Note: Results are based on KDB 447498 D01 (Section 7.2) Transmitters used in mobile devices exposure conditions for simultaneous transmission operations.

Simultaneous transmission MPE test exclusion applies when the sum of the MPE ratios for all simultaneously transmitting antennas incorporated in a host device is ≤ 1.0 , according to calculated/estimated, numerically modeled, or measured field strengths or power density. The MPE ratio of each antenna is determined at the minimum test separation distance required by the operating configurations and exposure conditions of the host device, according to the ratio of field strengths or power density to the MPE limit at the test frequency.

Cellular, BLE, radios can transmit simultaneously.

The formula for calculating the simultaneous MPE is

$$CPD1/LPD1 + CPD2/LPD2 + \dots + CPDn/LPDn < 1$$

CPD: Calculated Power Density

LPD: Limit of Power Density

$$\begin{aligned}
 \text{Simultaneous MPE} &= \text{Cellular} + \text{BLE} \\
 &= 0.038/0.466 + 0.025/1 \\
 &= 0.0815 + 0.025 \\
 &= 0.1065
 \end{aligned}$$

Result: 0.1065 < 1 (Pass)
