#### **Test Standard Used:**

IEEE Std. 1528-2013; IEC/IEEE 62209-1528:2020 FCC Rules and Regulations: 47 CFR § 2.1093; § 1.1310

#### **Test Procedure Used:**

KDB447498 D01 v06, KDB 865664 D01 v01r04, KDB 865664 D02 v01r02,

#### We Declare:

The equipment described above is tested by Tianjin Dongdian Testing Service Co., Ltd and in the configuration tested the equipment complied with the standards specified above. The test results are contained in this test report and Tianjin Dongdian Testing Service Co., Ltd is assumed of full responsibility for the accuracy and completeness of these tests.

After test and evaluation, our opinion is that the equipment provided for test compliance with the requirement of the above FCC standards.

# 1. Summary of Test Results

### 1.1. Max SAR results

| Band      | Test Position                       | Test mode | Max. Reported SAR (W/kg) | SAR limit<br>(W/kg) | Verdict |
|-----------|-------------------------------------|-----------|--------------------------|---------------------|---------|
| Pluotooth | Head(1-g) 0mm Extremities(10-g) 0mm | PD/EDD    | 0.1671                   | 1.6                 | Pass    |
| Bluetooth |                                     | 0.0557    | 4                        | Pass                |         |

Report No.: DDT-B22092306-3E01

### 1.2. RF exposure limits

| Human Exposure                               | Uncontrolled Environment General Population | Controlled Environment Occupational |
|--|---|-------------------------------------|
| Spatial Average SAR** (Whole Body)           | 0.08 W/kg                                   | 0.40 W/kg                           |
| Spatial Peak SAR* (Brain*Trunk)              | 1.60 W/kg                                   | 8.00 W/kg                           |
| Spatial Peak SAR*** (Hands/Feet/Ankle/Wrist) | 4.00 W/kg                                   | 20.00 W/kg                          |

Notes:

- 1) The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time
- 2) The Spatial Average value of the SAR averaged over the whole body.
- 3) The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.
- 4) Uncontrolled Environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.
- 5) Controlled Environments are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation.)

# 2. General Test Information

# 2.1. Description of EUT

| EUT Description     | : Wireless Headset ®                      |
|---------------------|---|
| Model Number        | : Play Gaming Wireless Headset            |
| Series Model Number | : JBuddies Play Gaming Wireless Headset   |
| Models different    | : Only the model number is different      |
| Trade Mark          | : JLAB                                    |
| Sample Type         | : Portable Device                         |
| Radio Specification | : Bluetooth: BR/EDR                       |
| Frequency Range     | : BR/EDR: 2402-2480MHz                    |
| Modulation          | : BR/EDR: GFSK, π/4-DQPSK, 8-DPSK         |
| Date Rate           | : BR/EDR: 1Mbps, 2Mbps, 3Mbps             |
| Antenna Type        | : Chip Antenna                            |
| Antenna Gain        | : Maximum PK gain 4.28dBi                 |
| Power Supply        | : DC 3.7V Polymer Li-ion built-in battery |

Note: EUT is the abbreviation of equipment under test.

### 2.2. RF Channel Information

|                 |                    | BR/EDR Chan | nel Information    |         |                    |
|-----------------|--------------------|-------------|--------------------|---------|--------------------|
| Channel         | Frequency<br>(MHz) | Channel     | Frequency<br>(MHz) | Channel | Frequency<br>(MHz) |

# 3. SAR Measurements System Configuration

### 3.1. The SAR Measurement System

This SAR Measurement System uses a Computer-controlled 3-D stepper motor system (SPEAG DASY5 professional system). A E-field probe is used to determine the internal electric fields. The SAR can be obtained from the equation SAR=  $\sigma$  (|Ei|2)/  $\rho$  where  $\sigma$  and  $\rho$  are the conductivity and mass density of the tissue-Simulate.

Report No.: DDT-B22092306-3E01

The DASY5 system for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot (Stabile RX family) with controller, teach pendant and software. An arm extension for accommodation the data acquisition electronics (DAE).
- An isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
- A data acquisition electronics (DAE) which performs the signal amplification, signal
  multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision
  detection, etc. The unit is battery powered with standard or rechargeable batteries. The
  signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion between optical and electrical
  of the signals for the digital communication to DAE and for the analog signal from the optical
  surface detection. The EOC is connected to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the (absolute) accuracy of the probe positioning.
- A computer operating Windows 7.
- DASY52 software.

- Remote control with teach pendant and additional circuitry for robot safety such as warning lamps, etc.
- The SAM twin phantom enabling testing left-hand, right-hand and Body Worn usage.
- The device holder for handheld mobile phones.
- Tissue simulating liquid mixed according to the given recipes.
- Validation dipole kits allowing to validating the proper functioning of the system.

#### 3.2. Isotropic E-field Probe EX3DV4

|               | Symmetrical design with triangular core<br>Built-in shielding against static charges<br>PEEK enclosure material (resistant to organic solvents,<br>e.g., DGBE)  |  |  |  |  |
|---------------|---|--|--|--|--|
| Calibration   | ISO/IEC 17025 calibration service available.  |  |  |  |  |
| Frequency     | 10 MHz to > 6 GHz<br>Linearity: ± 0.2 Db (30 MHz to 6 GHz)  |  |  |  |  |
| Directivity   | ± 0.3 Db in TSL (rotation around probe axis) ± 0.5 Db in TSL (rotation normal to probe axis)  |  |  |  |  |
| Dynamic Range | 10 μW/g to > 100 Mw/g Linearity: ± 0.2 Db (noise: typically < 1 μW/g)   |  |  |  |  |
| Dimensions    | Overall length: 337 mm (Tip: 20 mm)  Tip diameter: 2.5 mm (Body: 12 mm)  Typical distance from probe tip to dipole centers: 1 mm  |  |  |  |  |
| Application   | High precision dosimetric measurements in any exposure scenario (e.g., very strong gradient fields); the only probe that enables compliance testing for frequencies up to 6 GHz with precision of better 30%. |  |  |  |  |
| Compatibility | DASY3, DASY4, DASY52 SAR and higher, EASY4/MRI  |  |  |  |  |

#### 3.3. SAM Twin Phantom

| Material                                | Vinylester, glass fiber reinforced (VE-GF)                            |  |  |
|---|---|--|--|
| Liquid Compatibility                    | Compatible with all SPEAG tissue simulating liquids (incl. DGBE type) |  |  |
| Shell Thickness                         | $2 \pm 0.2$ mm (6 $\pm 0.2$ mm at ear point)                          |  |  |
| Dimensions<br>(incl. Wooden<br>Support) | Length: 1000 mm Width: 500 mm Height: adjustable feet                 |  |  |
| Filling Volume                          | 11esolut. 25 liters   |  |  |
| Wooden Support                          | SPEAG standard phantom table  |  |  |

Report No.: DDT-B22092306-3E01

The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528 and IEC 62209-1. It enables the dosimetric evaluation of left and right hand phone usage

as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by teaching three points with the robot.

Twin SAM V5.0 has the same shell geometry and is manufactured from the same material as Twin SAM V4.0, but has reinforced top structure.

#### 3.4. ELI Phantom

| Material             | Vinylester, glass fiber reinforced (VE-GF)                            |  |  |
|----------------------|---|--|--|
| Liquid Compatibility | Compatible with all SPEAG tissue simulating liquids (incl. DGBE type) |  |  |
| Shell Thickness      | 2 ± 0.2 mm (bottom plate)   |  |  |
| Dimensions           | Major axis: 600 mm<br>Minor axis: 400 mm                              |  |  |
| Filling Volume       | 12esolut. 30 liters   |  |  |
| Wooden Support       | SPEAG standard phantom table  |  |  |

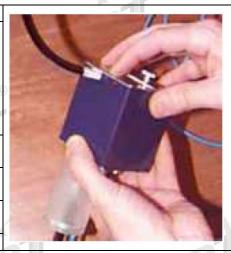

Report No.: DDT-B22092306-3E01

Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG dosimetric probes and dipoles.

ELI V5.0 has the same shell geometry and is manufactured from the same material as ELI4, but has reinforced top structure.

#### 3.5. Data Acquisition Electronics (DAE)

| Model                   | DAE4   |  |  |  |
|-------------------------|--|--|--|--|
| Construction            | Signal amplifier, multiplexer, A/D converter and control logic. Serial optical link for communication with DASY4/5 embedded system (fully remote controlled). Two step probe touch detector for mechanical surface detection and emergency robot stop. |  |  |  |
| Measurement             | -100 to +300 Mv (16 bit resolution and   |  |  |  |
| Range                   | two range settings: 4Mv,400Mv)   |  |  |  |
| Input Offset<br>Voltage | < 5Mv (with auto zero)   |  |  |  |
| Input Bias<br>Current   | < 50 f A   |  |  |  |
| Dimensions              | 60 x 60 x 68 mm  |  |  |  |
|                         |  |  |  |  |

#### 3.6. Device Holder for Transmitters

Report No.: DDT-B22092306-3E01

The DASY device holder is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear reference points). The rotation centres for both scales are the ear reference point (ERP). Thus the device needs no repositioning when changing the angles. The DASY device holder has been made out of low-loss POM material having the following dielectric parameters: relative permittivity  $\varepsilon$ =3 and loss tangent  $\delta$ =0.02. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

### 4. MEASUREMENT PROCEDURE

#### 4.1. Scanning procedure

#### **Step 1: Power reference measurement**

The "reference" and "drift" measurements are located at the beginning and end of the batch process. They measure the field drift at one single point in the liquid over the complete procedure.

Report No.: DDT-B22092306-3E01

#### Step 2: Area scan

The SAR distribution at the exposed side of the head was measured at a distance of 4mm from the inner surface of the shell. The area covered the entire dimension of the head and the horizontal grid spacing was 15mm\*15mm or 12mm\*12mm or 10mm\*10mm.Based on the area scan data, the area of the maximum absorption was determined by spline interpolation.

#### Step 3: Zoom scan

Around this point, a volume of 30mm\*30mm\*30mm (fine resolution volume scan, zoom scan) was assessed by measuring 5x5x7 points (≤2GHz) and 7x7x7 points (≥2GHz). On this basis of this data set, the spatial peak SAR value was evaluated with the following procedure:

The data at the surface was extrapolated, since the centre of the dipoles is 2.0mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.2mm. (This can be variable. Refer to the probe specification). The extrapolation was based on a least square algorithm. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip. The maximum interpolated value was searched with a straight-forward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1g or 10g) were computed using the 3D-Spline interpolation algorithm. The volume was integrated with the trapezoidal algorithm. One thousand points were interpolated to calculate the average. All neighbouring volumes were evaluated until no neighboring volume with a higher average value was found.

The area and zoom scan 14esolutionns specified in the table below must be applied to the SAR measurements Probe boundary effect error compensation is required for measurements with the probe tip closer than half a probe tip diameter to the phantom surface. Both the probe tip diameter and sensor offset distance must satisfy measurement protocols; to ensure probe boundary effect errors are minimized and the higher fields closest to the phantom surface can be correctly measured and extrapolated to the phantom surface for computing 1-g SAR. Tolerances of the post-processing algorithms must be verified by the test laboratory for the scan resolutions used in the SAR measurements, according to the reference distribution functions specified in IEEE 1528-2013.

|   |   |   | ≤3 GHz   | > 3 GHz  |  |
|---|---|---|--|--|--|
| Maximum distance fro<br>(geometric center of p  |   | measurement point rs) to phantom surface  | 5 mm $\pm$ 1 mm $\frac{1}{2} \cdot \delta \cdot \ln(2)$ mm $\pm 0.5$   |  |  |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location |   |   | 30° ± 1°   | 20° ± 1°   |  |
|   |   |   | $\leq$ 2 GHz: $\leq$ 15 mm 3 - 4 GHz: $\leq$ 12 m<br>2 - 3 GHz: $\leq$ 12 mm 4 - 6 GHz: $\leq$ 10 m  |  |  |
| Maximum area scan spatial resolution: $\Delta x_{Area}, \Delta y_{Area}$                  |   |   | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be $\leq$ the corresponding x or y dimension of the test device with at least one measurement point on the test device. |  |  |
| Maximum zoom scan   | spatial res   | olution: $\Delta x_{Zoom}$ , $\Delta y_{Zoom}$  | ≤ 2 GHz: ≤ 8 mm<br>2 – 3 GHz: ≤ 5 mm*  | 3 – 4 GHz: ≤ 5 mm*<br>4 – 6 GHz: ≤ 4 mm*   |  |
|   | uniform   | grid: Δz <sub>Zoom</sub> (n)  | ≤ 5 mm   | $3 - 4 \text{ GHz: } \le 4 \text{ mm}$<br>$4 - 5 \text{ GHz: } \le 3 \text{ mm}$<br>$5 - 6 \text{ GHz: } \le 2 \text{ mm}$ |  |
| Maximum zoom<br>scan spatial<br>resolution, normal to<br>phantom surface graded           |   | Δz <sub>Zoom</sub> (1): between<br>1 <sup>st</sup> two points closest<br>to phantom surface | ≤ 4 mm   | 3 – 4 GHz: ≤ 3 mm<br>4 – 5 GHz: ≤ 2.5 mm<br>5 – 6 GHz: ≤ 2 mm  |  |
|   | grid $\Delta z_{Zoom}(n>1)$ : between subsequent points |   | $\leq 1.5 \cdot \Delta z_{Zoom}(n-1) \text{ mm}$   |  |  |
| Minimum zoom<br>scan volume   | X V Z   |   | ≥ 30 mm  | 3 – 4 GHz: ≥ 28 mm<br>4 – 5 GHz: ≥ 25 mm<br>5 – 6 GHz: ≥ 22 mm   |  |

Report No.: DDT-B22092306-3E01

Note:  $\delta$  is the penetration depth of a plane-wave at normal incidence to the tissue medium; see IEEE Std 1528-2013 for details.

#### Step 4: Power reference measurement (drift)

The Power Drift Measurement job measures the field at the same location as the most recent power reference measurement job within the same procedure, and with the same settings. The indicated drift is mainly the variation of the DUT's output power and should vary max.  $\pm 5$  %

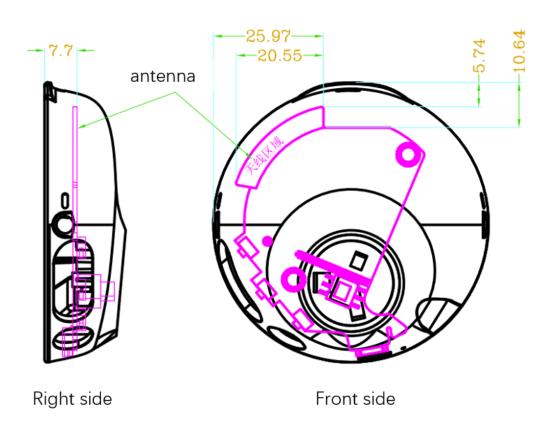

#### Step 5: Z-Scan (FCC only)

The Z scan measures points along a vertical straight line. The line runs along the Z-axis of a onedimensional grid. In order to get a reasonable extrapolation the extrapolated distance should not be greater than the step size in Z-direction.

<sup>\*</sup> When zoom scan is required and the <u>reported</u> SAR from the <u>area scan based 1-g SAR estimation</u> procedures of KDB Publication 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

# 5. RF EXPOSURE CONDITIONS

### 5.1. EUT sides

#### Note:

- 1. The antenna is located in the right ear.
- 2. The logo side set as the front side to test.

### 5.2. Standalone SAR Test Exclusion Considerations

According to the KDB447498, the SAR test exclusion threshold:

| MHz  | 5   | 10  | 15  | 20  | 25  | mm                    |
|------|-----|-----|-----|-----|-----|-----------------------|
| 150  | 39  | 77  | 116 | 155 | 194 |                       |
| 300  | 27  | 55  | 82  | 110 | 137 |                       |

#### 5.3. Test sides and test exclusion

For 100 MHz to 6 GHz and test separation distances ≤ 50 mm, the 1-g and 10-g SAR test exclusion thresholds are determined by the following:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance,

mm)]  $\cdot [\sqrt{f(GHz)}] \le 3.0$  for 1-g SAR and  $\le 7.5$  for 10-g SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

For 100 MHz to 6 GHz and test separation distances > 50 mm, the 1-g and 10-g SAR test exclusion thresholds are determined by the following:

- 1) {[Power allowed at numeric threshold for 50 mm in above step)] + [(test separation distance 50 mm)·(f(MHz)/150)]} mW, for 100 MHz to 1500 MHz
- 2) {[Power allowed at numeric threshold for 50 mm in above step)] + [(test separation distance 50 mm)·10]} mW, for > 1500 MHz and  $\leq 6 \text{ GHz}$

|        |      |           | SAR test sides |              |      |       |
|--------|------|-----------|----------------|--------------|------|-------|
|        |      |           | Head           |              |      |       |

## 6.1.2. Measurement for Tissue Simulate Liquid

The dielectric properties for this Tissue Simulate Liquids were measured by using the Agilent Model 85070E Dielectric Probe in conjunction with Agilent E5071C Network Analyzer (300 KHz-8500 MHz). The Conductivity ( $\sigma$ ) and Permittivity ( $\rho$ ) are listed in table. For the SAR measurement given in this report. The temperature variation of the Tissue Simulate Liquids was 22±2°C.

| Tissue<br>Type | Freq. | Target Tiss                | Measured<br>Tissue     |        | Liquid<br>Temp. | Measured |            |

Report No.: DDT-B22092306-3E01

### 6.2. SAR System Validation

The microwave circuit arrangement for system verification is sketched in bellow figure. The daily system accuracy verification occurs within the flat section of the SAM phantom. A SAR measurement was performed to see if the measured SAR was within +/- 10% from the target SAR values. The tests were conducted on the same days as the measurement of the EUT. The obtained results from the system accuracy verification are displayed in the table 5 (A power level of 250mw was input to the dipole antenna). During the tests, the ambient temperature of the laboratory was in the range 22±2°C, the relative humidity was in the range 60% and the liquid depth above the ear reference points was above 15 cm in all the cases. It is seen that the system is operating within its specification, as the results are within acceptable tolerance of the reference values.

# 6.2.1. Justification for Extended SAR Dipole Calibrations

Att3

- 1) Referring to KDB865664 D01 requirements for dipole calibration, instead of the typical annual calibration recommended by measurement standards, longer calibration intervals of up to three years may be considered when it is demonstrated that the SAR target, impedance and return loss of a dipole have remain stable according to the following requirements. Each measured dipole is expected to evaluate with the following criteria at least on annual interval in Appendix C.
- a) There is no physical damage on the dipole;
- b) System check with specific dipole is within 10% of calibrated value;
- c) Return-loss is within 10% of calibrated measurement;
- d) Impedance is within  $5\Omega$  from the previous measurement.
- 2) Network analyzer probe calibration against air, distilled water and a shorting block performed before measuring liquid parameters.

Report No.: DDT-B22092306-3E01

#### Note:

- 1. The output power of the device was set to transmit at maximum power for all test.
- 2.The BR/EDR maximum output power mode is DH5, select DH5 mode to test SAR.

### 9.2. Measurement of SAR Data

#### 9.2.1. SAR Result of Bluetooth BR/EDR

#### Note:

- 1)The maximum Scaled SAR value is marked in bold. Graph Results refer to Appendix B
- 2)If the reported (scaled) SAR measured at the middle channel or highest output power channel for each test configuration is  $\leq 0.8$  W/kg then testing at the other channels is not required for such test configuration(s).
- 3)Scaled factor= (Max. Tune-up Power in mW) / (Conducted Power in mW) / (Duty Cycle)
- 4)Scaled SAR=Test SAR \* Scaled factor
