## 1. RF Exposure Evaluation

### 1.1. Limits

#### SAR Test Exclusion Thresholds for 100 MHz - 6 GHz and ≤ 50 mm

Approximate SAR Test Exclusion Power Thresholds at Selected Frequencies and Test Separation Distances are illustrated in the following Table. The equation and threshold in Note 1 must be applied to determine SAR test exclusion.

| MHz  | 5   | 10  | 15  | 20  | 25  | mm        |
|------|-----|-----|-----|-----|-----|-----------|
| 150  | 39  | 77  | 116 | 155 | 194 | SAR Test  |
| 300  | 27  | 55  | 82  | 110 | 137 | Exclusion |
| 450  | 22  | 45  | 67  | 89  | 112 | Threshold |

Note: The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

FCC ID: 2Al3G-C1510 Page Number: 3 of 5

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] \*  $[\sqrt{f(GHz)}] \le 3.0$  for 1-g SAR and  $\le 7.5$  for 10-g extremity SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison
- 3.0 and 7.5 are referred to as the numeric thresholds in the step 2 below

The test exclusions are applicable only when the minimum test separation distance is  $\leq$  50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

#### 1.2. Test Procedure

Software provided by client enabled the EUT to transmit and receive data at lowest, middle and highest channel individually.

The temperature and related humidity: 18°C and 78% RH.

## 1.3. Test Result of RF Exposure Evaluation

| Product   | In-ear Bluetooth       |
|-----------|------------------------|
| Test Item | RF Exposure Evaluation |

Antenna Gain: The maximum Gain measured in fully anechoic chamber is 1.51dBi for 2.4GHz in logarithm scale.

### **Output Power into Antenna:**

| Test Mode | Frequency Band<br>(MHz) | Maximum output power to antenna | E.I.R.P.<br>(mW) | SAR Test Exclusion Threshold (mW) |
|-----------|-------------------------|---------------------------------|------------------|-----------------------------------|
|           | (IVII 12)               | (mW)                            | (11100)          | Tilleshold (IIIVV)                |
| Bluetooth | 2402 ~ 2480             | 0.944                           | 1.34             | 10                                |

Note: Max conducted power = -0.25 dBm = 0.944 mW;

Max E.I.R.P. = -0.25 dBm + 1.51 dBi = 1.26 dBm = 1.34 mW.

Per FCC KDB 447498 D01v06, the SAR exclusion threshold for distances<50mm is defined by the following equation:

$$\frac{Max\ Power\ of\ Channel\ (mW)}{Test\ Separation\ Dist\ (mm)}*\sqrt{Frequency(GHz)} \leq 3.0$$

Based on the maximum conducted power of Bluetooth and the antenna to use separation distance, Bluetooth SAR was not required;

$$[(0.944 \text{mW/5})^* \sqrt{2.402}] = 0.293 < 3.0$$

The Max  $P_d = 0.293 < 3.0$ 

Note: When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.
