RF TEST REPORT

Application No.:	SHEM1606003983CR
Applicant:	Huangshan Goldenland Electronics Inc.
FCC ID:	2AI3UDMAG
Equipment Under Test (EUT): **NOTE:** The following sample(s) was/were submitted and identified by the client as	
Product Name:	Display
Model No.(EUT):	Mag
Standards:	FCC PART 15 Subpart C: 2016
Date of Receipt:	2016-12-15
Date of Test:	2016-12-15 to 2017-2-7
Date of Issue:	2017-2-7
Test Result:	**Pass***

* In the configuration tested, the EUT (Equipment under test) complied with the standards specified above.

Parlam Zhan
E&E Section Manager
SGS-CSTC (Shanghai) Co., Ltd.

2 Test Summary

Test Item	FCC Requirement	Test method	Result
Antenna Requirement	FCC Part 15, Subpart C Section 15.203/15.247 (c)	---	PASS
AC Power Line Conducted Emission	FCC Part 15, Subpart C Section 15.207	ANSI C63.10 (2013) Section 6.2	PASS
20dB Occupied Bandwidth	FCC Part 15, Subpart C Section 15.247 (a)(1)	ANSI C63.10 (2013) Section 6.9.2	PASS
Conducted Peak Output Power	FCC Part 15, Subpart C Section 15.247 (b)(2)	ANSI C63.10 (2013) Section 7.8.5	PASS
Carrier Frequencies Separation	FCC Part 15, Subpart C Section 15.247 (a)(1)	ANSI C63.10 (2013) Section 7.8.2	PASS
Hopping Channel Number	FCC Part 15, Subpart C Section 15.247 (a)(1)	ANSI C63.10 (2013) Section 7.8.3	PASS
Dwell Time	FCC Part 15, Subpart C Section 15.247 (a)(1)	ANSI C63.10 (2013) Section 7.8.4	PASS
Conducted Spurious Emissions and Band-edge	FCC Part 15, Subpart C Section 15.247(d)	ANSI C63.10 (2013) Section 7.8.6&7.8.8	PASS
Radiated Spurious Emissions and Band-edge	FCC Part 15, Subpart C Section 15.209&15.205	ANSI C63.10 (2013) Section 6.4&6.5&6.6&6.10	PASS

4 General Information

4.1 Client Information

Applicant:	Huangshan Goldenland Electronics Inc.
Address of Applicant:	North Industrial Park, Huizhou District, Huangshan, Anhui Province, P.R. China
Manufacturer:	Huangshan Goldenland Electronics Inc.
Address of Manufacturer:	North Industrial Park, Huizhou District, Huangshan, Anhui Province, P.R. China
Factory:	Huangshan Goldenland Electronics Inc.
Address of Factory:	North Industrial Park, Huizhou District, Huangshan, Anhui Province, P.R. China

4.2 General Description of E.U.T.

Product Description:	Fixed product with 915MHz transmitting function
Rated Input:	DC 11.1V by Li-on Rechargeable Battery Supply the EUT with full charged battery during the testing.

4.3 Technical Specifications

Operation Frequency:	902.5MHz-927.5MHz
Modulation Technique:	FHSS(GFSK)
Channel separation:	500kHz
Number of Channel:	at least 50
Antenna Type	Dipole antenna Antenna 1: AC-Q915I08 Antenna 2: AC-Q915-L20D

4.4 Description of Support Units

The EUT has been tested with associated equipment below.

Description	Manufacturer	Model No.	Supplied by
/	/	/	/

4.5 Test Mode

Test Mode	Description of Test Mode
Hopping disabled mode	Using test software to control EUT working in continuous transmitting, and select channel and modulation type.
Hopping enabled mode	Using test software to control EUT working in continuous transmitting, and hopping on status.

The packet type used for the final test:

Test Item	Sequence			Test Frequency		
	0	4	9	Low 902.5MHz	Middle 915.2MHz	High 927.5Mhz
CE	-	-	-	-	-	-
20dB OBW	-	-		√	√	√

Peak Power	-	-	-	√	√	-
CFS	√	√	√	-	-	-
HCN	√	√	√	-	-	-
Dwell Time	√	√	√	-	-	-
CSE	-	-	-	√	√	√
Conducted Band-edge	-	-	-	√	√	√
RSE & Band-edge	-	-	-	√	√	√
99% OBW	-	-	-	√	√	√

Radiated pre-test was performed with antenna AC-Q915I08 and AC-Q915-L20D, and the worst test result with AC-Q915I08 was listed in the report.

4.6 Test Location

All tests were performed at:

SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd.

588 West Jindu Road, Xinqiao, Songjiang, 201612 Shanghai, China

Tel: +86 21 6191 5666

Fax: +86 21 6191 5678

4.7 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

- **CNAS (No. CNAS L0599)**

CNAS has accredited SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd. to ISO/IEC 17025:2005 General Requirements for the Competence of Testing and Calibration Laboratories (CNAS-CL01 Accreditation Criteria for the Competence of Testing and Calibration Laboratories) for the competence in the field of testing.

- **FCC – Registration No.: 402683**

SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd. has been registered and fully described in a report filed with the Federal Communications Commission (FCC). The acceptance letter from the FCC is maintained in our files. Registration No.: 402683.

- **Industry Canada (IC) – IC Assigned Code: 8617A**

The 3m Semi-anechoic chamber of SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd. has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No.: 8617A-1.

- **VCCI (Member No.: 3061)**

The 3m Semi-anechoic chamber and Shielded Room of SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd. has been registered in accordance with the Regulations for Voluntary Control Measures with Registration No.: R-3868, C-4336, T-2221, G-830 respectively.

4.8 Measurement Uncertainty

No.	Parameter	Measurement Uncertainty
1	Radio Frequency	< ±1 x 10^{-5}
2	Total RF power, conducted	< ±1.5 dB
3	RF power density, conducted	< ±3 dB
4	Spurious emissions, conducted	< ±3 dB
5	All emissions, radiated	< ±6 dB (Below 1GHz) < ±6 dB (Above 1GHz)
6	Temperature	< ±1°C
7	Humidity	< ±5 %
8	DC and low frequency voltages	< ±3 %

5 Equipments Used during Test

No.	Equipment	Manufacturer	Model No.	Inventory No.	Cal. Date	Cal. Due date

6 Test Results

6.1 E.U.T. test conditions

Requirements: 15.31(e) For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

Operating Environment:

Temperature:	20.0 -25.0 °C
Humidity:	35-75 % RH
Atmospheric Pressure:	99.2 -102 kPa

Test frequencies: According to the 15.31(m) Measurements on intentional radiators or receivers, other than TV broadcast receivers, shall be performed and. if required. reported for each band in which the device can be operated with the device operating at the number of frequencies in each band specified in the following table:

Frequency range over which device operates	Number of frequencies	Location in the range of operation
1 MHz or less	1	Middle
1 to 10 MHz	2	1 near top and 1 near bottom
More than 10 MHz	3	1 near top. 1 near middle and 1 near bottom

Pursuant to Part 15.31(c) For swept frequency equipment, measurements shall be made with the frequency sweep stopped at those frequencies chosen for the measurements to be reported.

6.2 Frequency Hopping System Requirement

Test Requirement: Section 15.247 (a)(1), (g), (h) requirement:

The system shall hop to channel frequencies that are selected at the system hopping rate from a Pseudorandom ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

Frequency hopping spread spectrum systems are not required to employ all available hopping channels during each transmission. However, the system, consisting of both the transmitter and the receiver, must be designed to comply with all of the regulations in this section should the transmitter be presented with a continuous data (or information) stream. In addition, a system employing short transmission bursts must comply with the definition of a frequency hopping system and must distribute its transmissions over the minimum number of hopping channels specified in this section.

The incorporation of intelligence within a frequency hopping spread spectrum system that permits the system to recognize other users within the spectrum band so that it individually and independently chooses and adapts its hop sets to avoid hopping on occupied channels is permitted. The coordination

of frequency hopping systems in any other manner for the express purpose of avoiding the simultaneous occupancy of individual hopping frequencies by multiple transmitters is not permitted.

Operational Description

There are 10 available hopping sequences:
Hopping sequence 0 uses channels: 0, 10, 20, 30 … 490.
Hopping sequence 1 uses channels: 1, 11, 21, 31 … 491.
…
Hopping sequence 9 uses channels: 9, 19, 29, 39 … 499.

For every hopping sequence the channels are organized in pseudorandom sequence in the internal table.

```
22,  5, 30, 20,  0,  4, 39,  2, 34,  7,
41, 48, 21, 47, 17, 27,  8, 24,  6,  1,
26, 31, 12, 23, 25, 19,  3,  9, 46, 29,
33, 32, 14, 37, 40, 10, 13, 36, 38, 44,
11, 35, 15, 18, 43, 42, 49, 45, 16, 28
```

These are frequency numbers inside the hopping sequence (row numbers), not the channel numbers.

For example, for the hopping sequence **#2** the actual channel numbers used during transmission are:

```
222,  52, 302, 202,  02,  42, 392,  22, 342,  72,
412, 482, 212, 472, 172, 272,  82, 242,  62,  12,
262, 312, 122, 232, 252, 192,  32,  92, 462, 292,
332, 322, 142, 372, 402, 102, 132, 362, 382, 442,
112, 352, 152, 182, 432, 422, 492, 452, 162, 282
```

Not all 10 sequences may be available to the end user depending on the specific application.

User can select one of the available hopping sequences during system configuration. It is done manually by using keypad and user interface menu structure. It is referred to as “channel” in the user menu and documentation.
The same hopping sequence has to be selected on both locator and display.

	Hopping sequence number									
	0	1	2	3	4	5	6	7	8	9
0	902.500	902.550	902.600	902.650	902.700	902.750	902.800	902.850	902.900	902.950

490	927.000	927.050	927.100	927.150	927.200	927.250	927.300	927.350	927.400	927.450
500	927.500									

6.3 Antenna Requirement

Standard requirement:

15.203 requirement:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited

15.247(b) (4) requirement:

The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

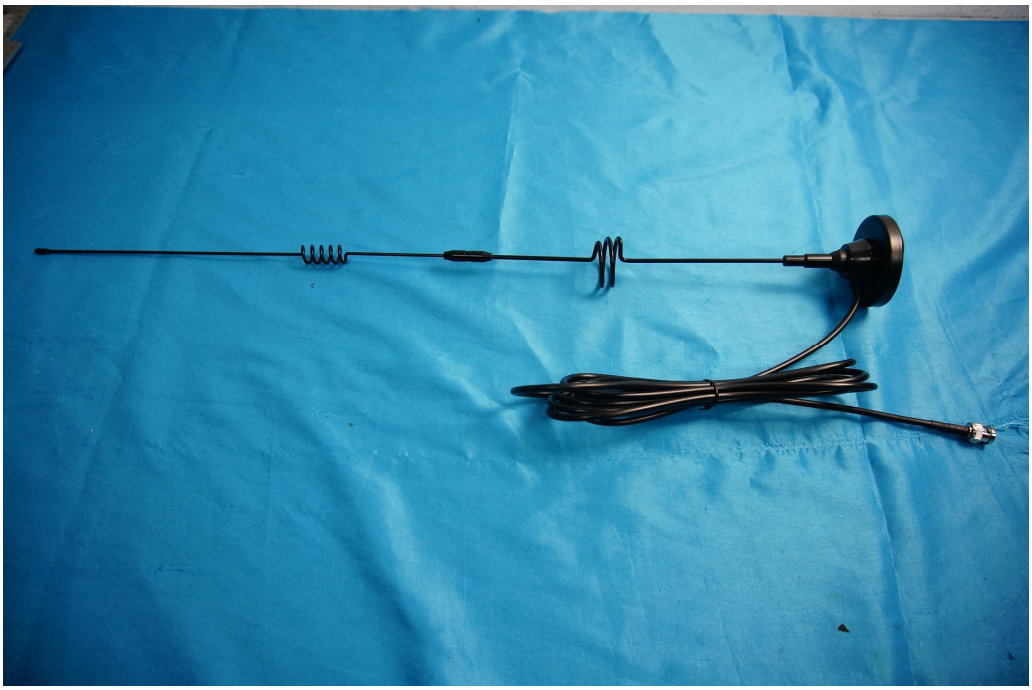
EUT Antenna:

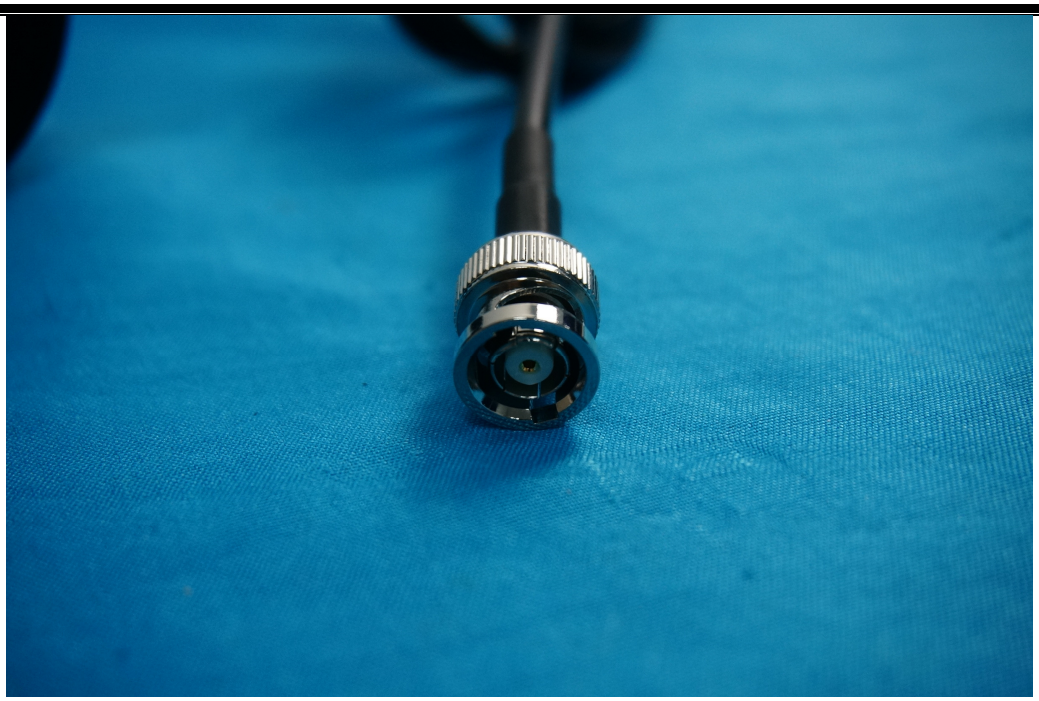
RP BNC connector

Antenna 1: **AC-Q915-L20D** is Dipole antenna.

Gain:3dBi

Antenna 2: **AC-Q915I08** is Dipole antenna.
Gain:5dBi





6.4 Conducted Emissions on Mains Terminals

Frequency Range: 150 KHz to 30 MHz

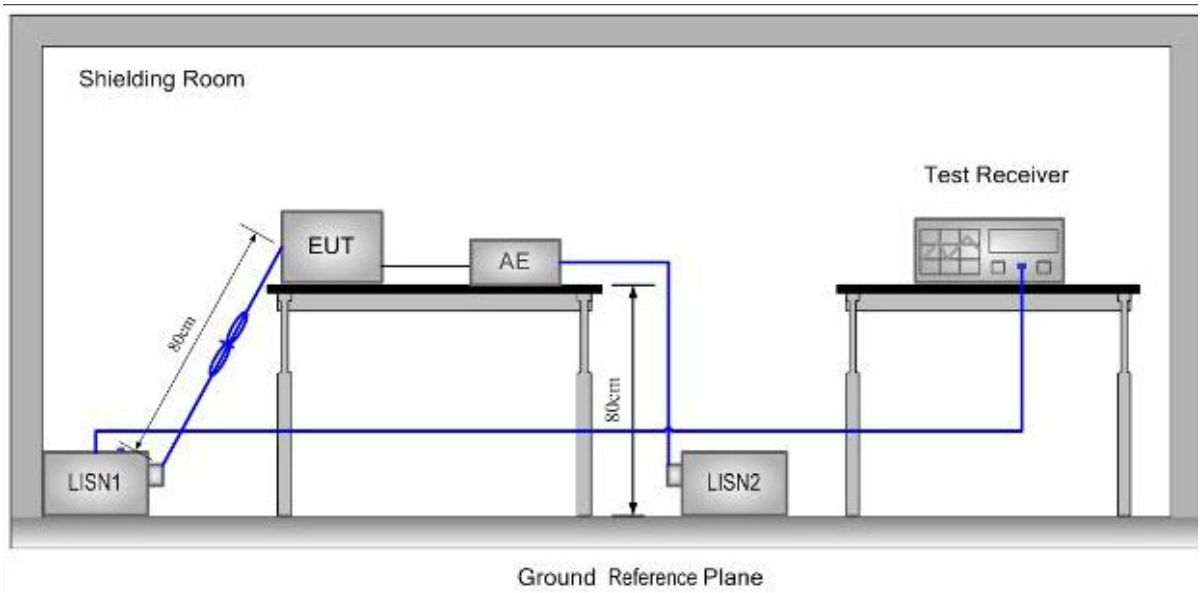
Limit:

Frequency range MHz	Class B Limits: dB (μV)	
	Quasi-peak	Average
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5	56	46
5 to 30	60	50

Note1: The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50MHz.

Note2: The lower limit is applicable at the transition frequency.

Test Setup:



Test Procedure:

1) The mains terminal disturbance voltage was measured with the EUT in a shielded room.
2) The EUT was connected to AC power source through a LISN 1 (Line Impedance Stabilization Network) which provides 50Ω/50μH + 5Ω linear impedance. The power cables of all other units of the EUT were connected to a second LISN, which was bonded to the ground reference plane in the same way as the LISN for the unit being measured. A multiple socket outlet strip was used to connect multiple power cables to a single LISN provided the rating of the LISN was not exceeded
3) The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane, but separated from metallic contact with the ground reference plane by 0.1m of insulation.
4) The test was performed with a vertical ground reference plane. The rear of the EUT shall be 0.4 m from the vertical ground reference plane. The vertical ground reference plane was bonded to the horizontal ground reference plane. The LISN was placed 0.8 m from the boundary of the unit under test and bonded to a ground reference plane for LISN mounted on top of the ground reference plane. This distance was between the closest points of the LISN and the EUT. The mains lead of EUT excess 0.8m was folded back and forth parallel to the lead so as to form a horizontal bundle with a length between 0.3m and 0.4m. All other units of the EUT and associated

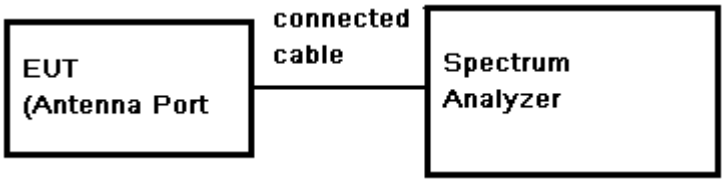
equipment were at least 0.8 m from the LISN.

Remark: Pre-scan was performed with peak detected on all ports, Quasi-peak & average measurements were performed at the frequencies at which maximum peak emission level were detected. Pretest under all modes; choose the worst case mode (GFSK and Hopping enabled mode) record on the report. Please see the attached Quasi-peak and Average test results.

This EUT is powered by battery only; therefore the test on mains terminals is not applicable.

6.5 20dB Occupied Bandwidth

Test Configuration:



Test Procedure:

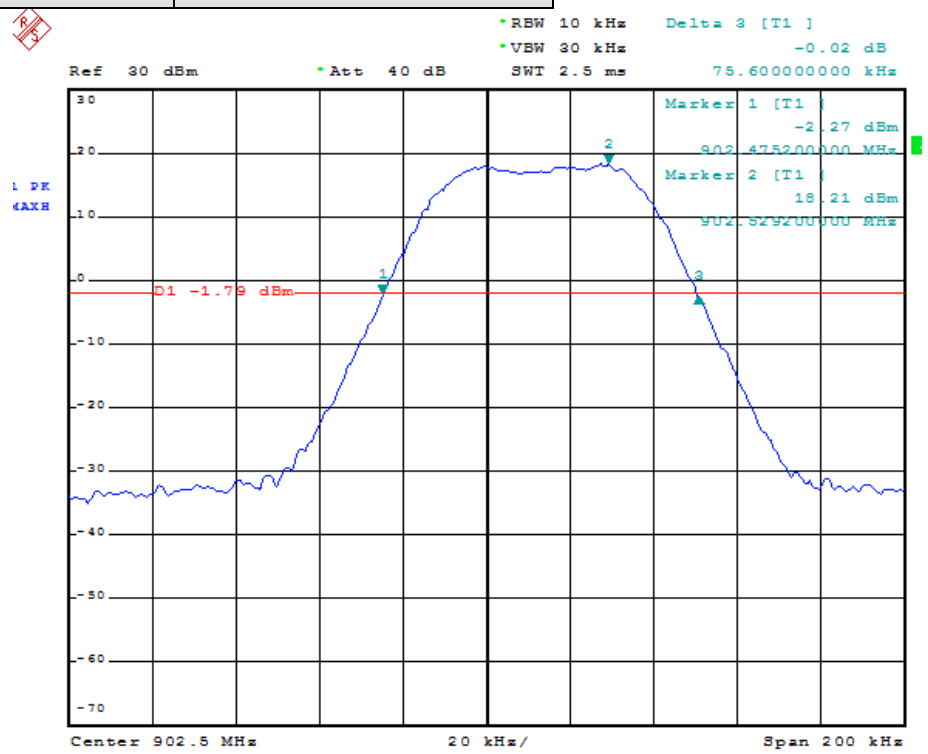
1) Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum;
2) Set the spectrum analyzer: Span = approximately 2 to 5 times the OBW, centred on the hopping channel;
3) Set the spectrum analyzer: RBW >= 1% to 5% of the OBW (set 10 kHz). VBW >= RBW. Sweep = Auto; Detector = Peak. Trace = Max Hold.
4) Mark the peak frequency and -20dB points.

Test Date:

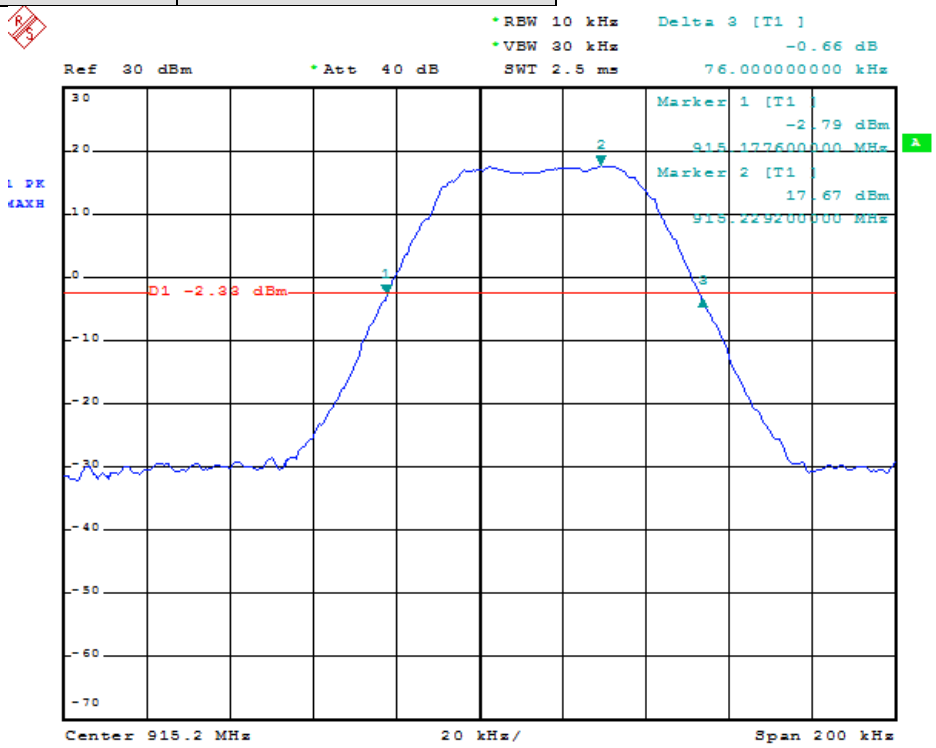
Test Frequency(MHz)	Bandwidth(kHz)
Low	75.6
Middle	76.0
High	75.6

Test plot as follows:

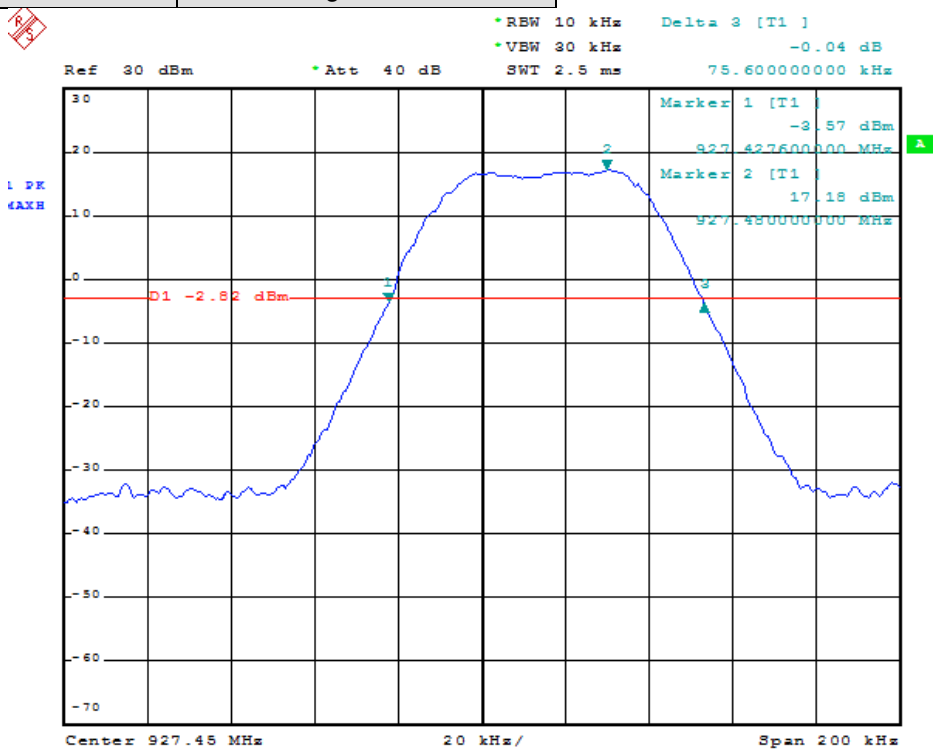
Test mode	channel: Low



Test mode	channel: Middle

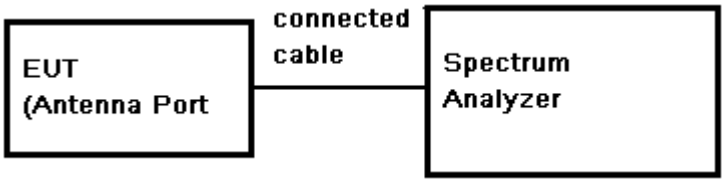


Test mode	channel: High



6.6 Conducted Peak Output Power

Test Configuration:



Test Procedure:

1) Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum.
2) Set the spectrum analyzer: RBW = 3 MHz, VBW = 10 MHz, Sweep = auto; Detector Function = Peak.
3) Keep the EUT in transmitting at lowest, middle and highest channel individually. Record the max value.

Test Limit:

Regulation 15.247 (b)(2)
For frequency hopping systems operating in the 902–928 MHz band: 1 watt for systems employing at least 50 hopping channels; and 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels, as permitted under paragraph (a)(1)(i) of this section.

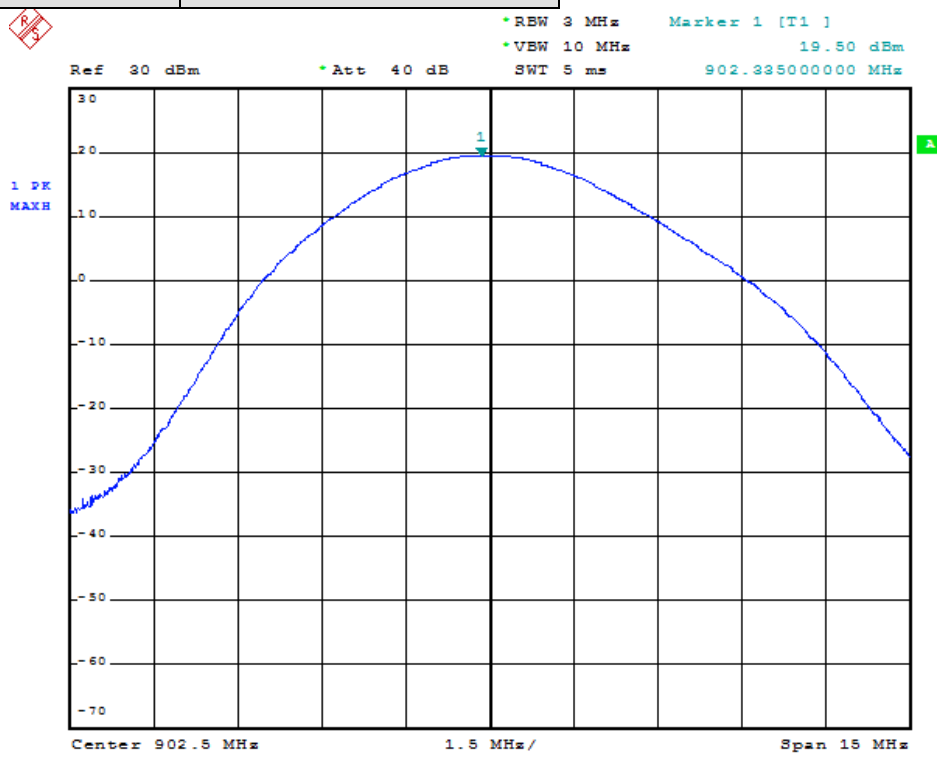
Test Data:

Test Frequency (MHz)	Reading Power (dBm)	Cable Loss (dB)	Output Power (dBm)	Limit (dBm)	Test Result
Low	19.5	0.5	20.0	30	Pass
Middle	19.26		19.76		Pass
High	18.83		19.33		Pass

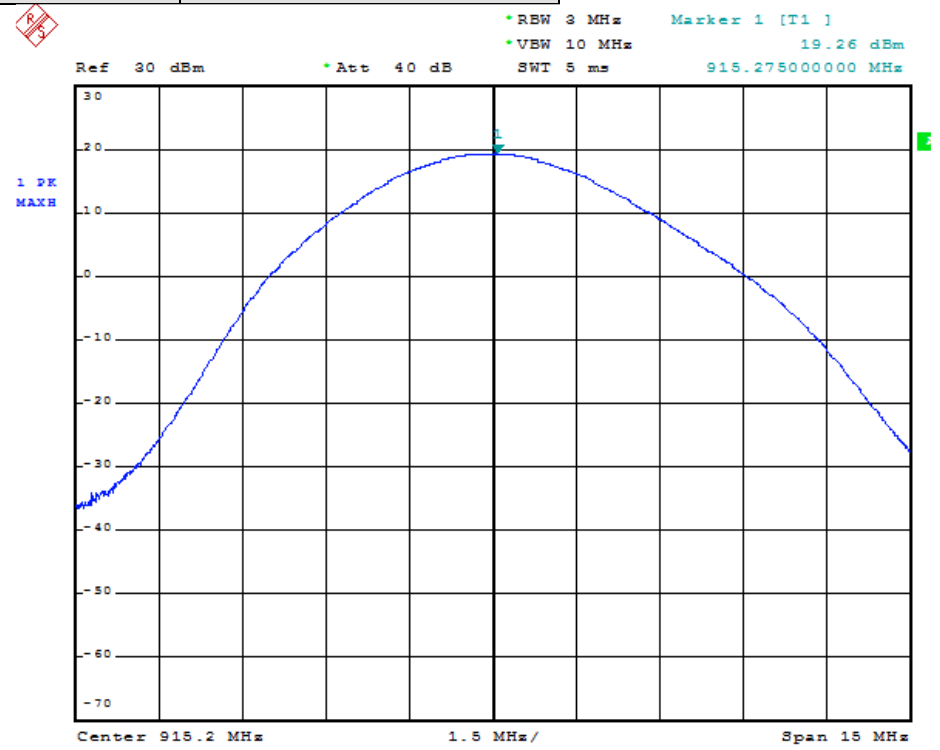
Remark: Output Power=Reading Power + Cable loss

Test plot as follows:

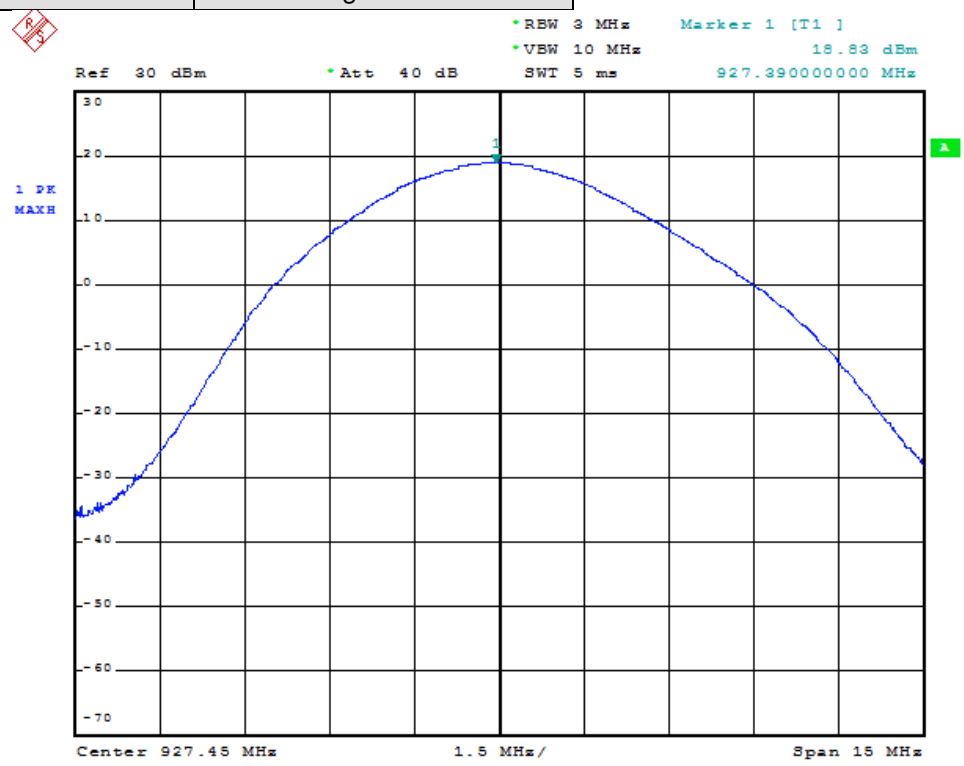
Test mode	channel: Low



Test mode	channel: Middle

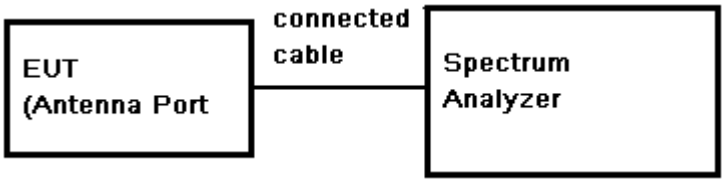


Test mode	channel: High



6.7 Carrier Frequencies Separated

Test Configuration:



Test Procedure:

1) Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum.
2) Set the spectrum analyzer: RBW >= 1% of the span (set 30 kHz). VBW >= RBW, Span = 3MHz. Sweep = auto; Detector Function = Peak. Trace = Maxhold.
3) Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels. The limit is specified in one of the subparagraphs of this Section. Submit this plot.

Limit: 0.025MHz or 20dB bandwidth (whichever is greater)

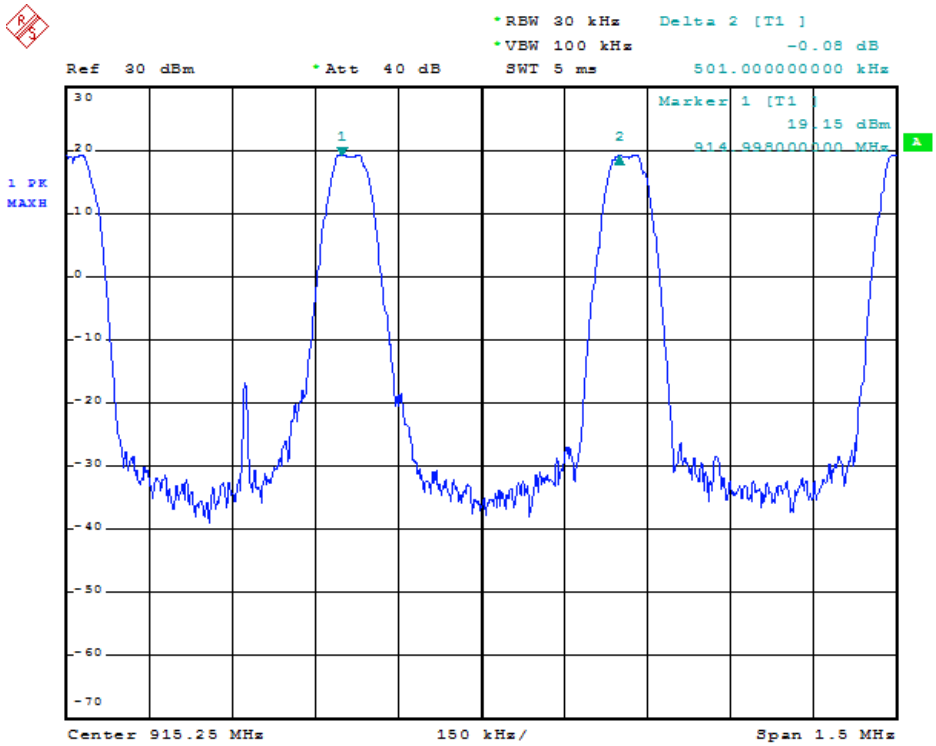
Test data:

Test Sequence	Carrier Frequencies Separated (kHz)	Limit	Test Result
0	501	75.6	Pass
4	498	76.0	Pass
9	498	75.6	Pass

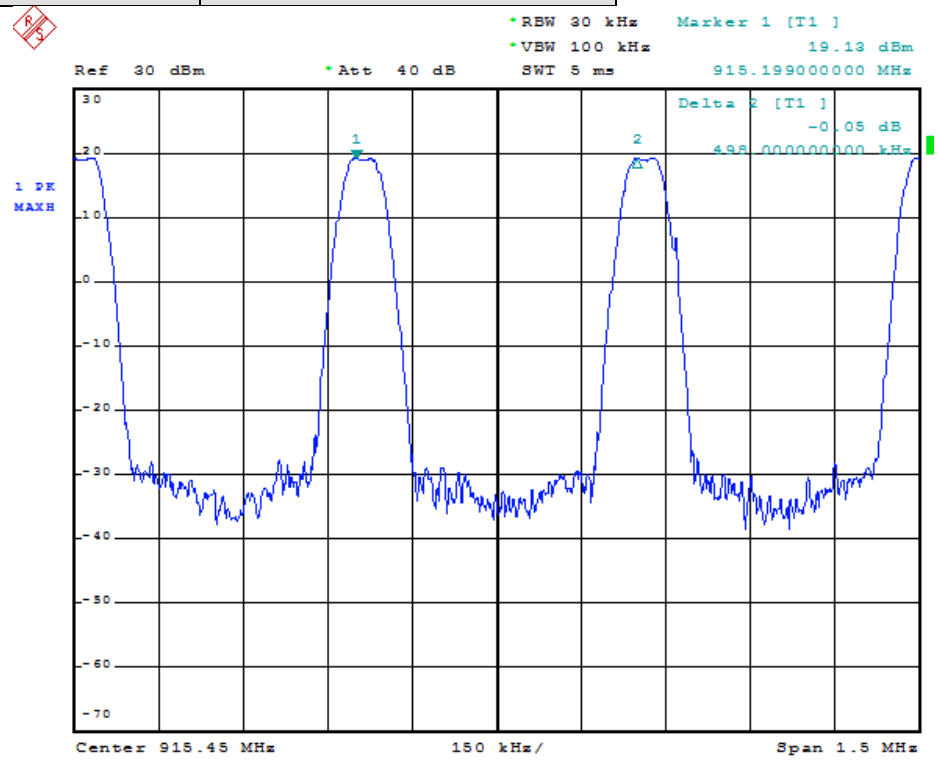
Remark: 20dB bandwidth reference Section 6.5

Test plot as follows:

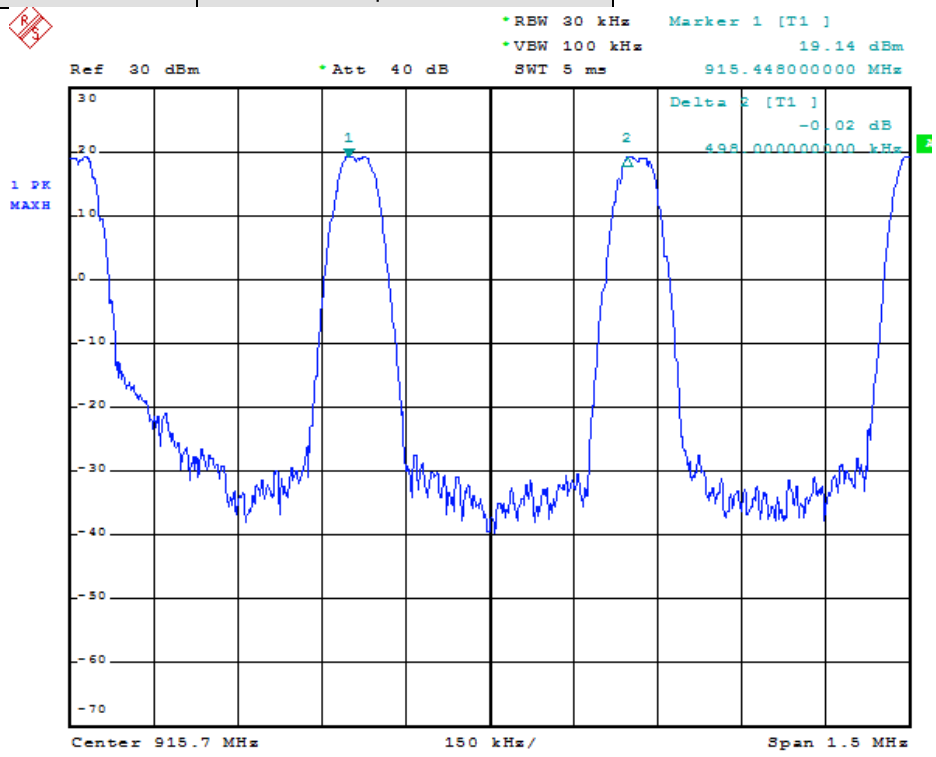
Test mode	Sequence 0



Test mode	Sequence 4

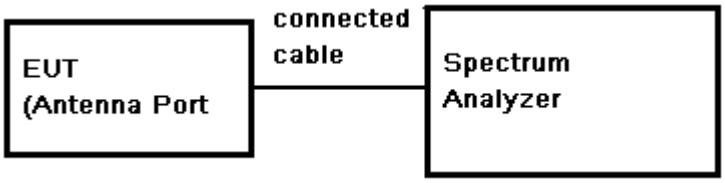


Test mode	Sequence 9



6.8 Hopping Channel Number

Test Configuration:



Test Procedure:

1) Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum.
2) Set the spectrum analyzer: RBW = 100 kHz. VBW = 300 kHz. Sweep = auto; Detector Function = Peak. Trace = Max hold.
3) Allow the trace to stabilize. It may prove necessary to break the span up to sections. in order to clearly show all of the hopping frequencies. The limit is specified in one of the subparagraphs of this Section.
4) Set the spectrum analyzer: start frequency = 902MHz. stop frequency = 928MHz. Submit the test result graph.

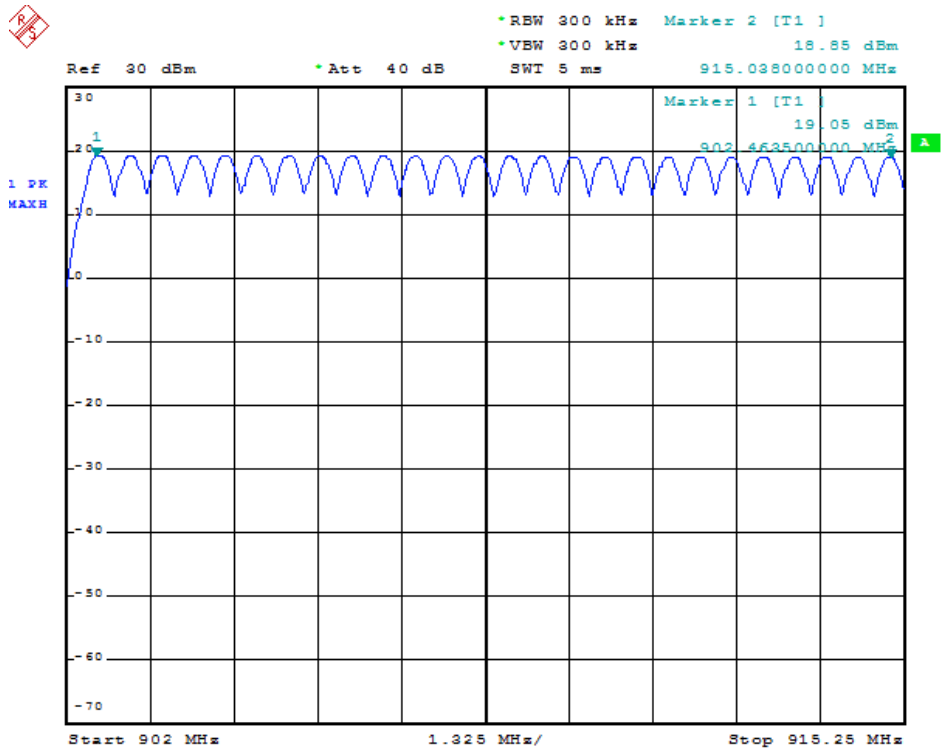
Limit:

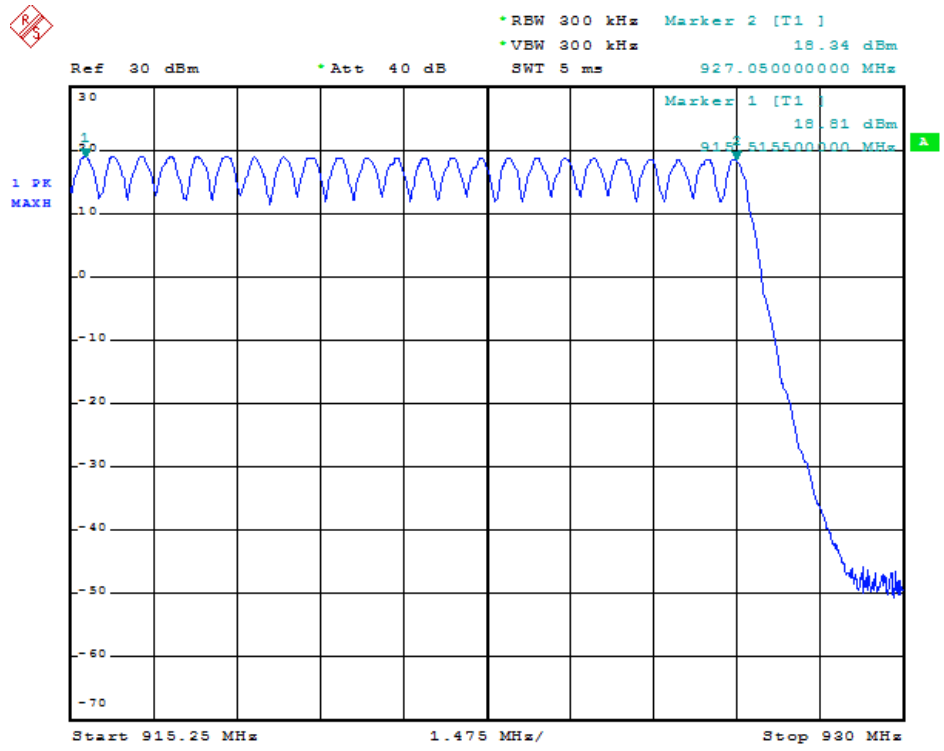
Regulation 15.247(a)(1) (i) For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Test Data:

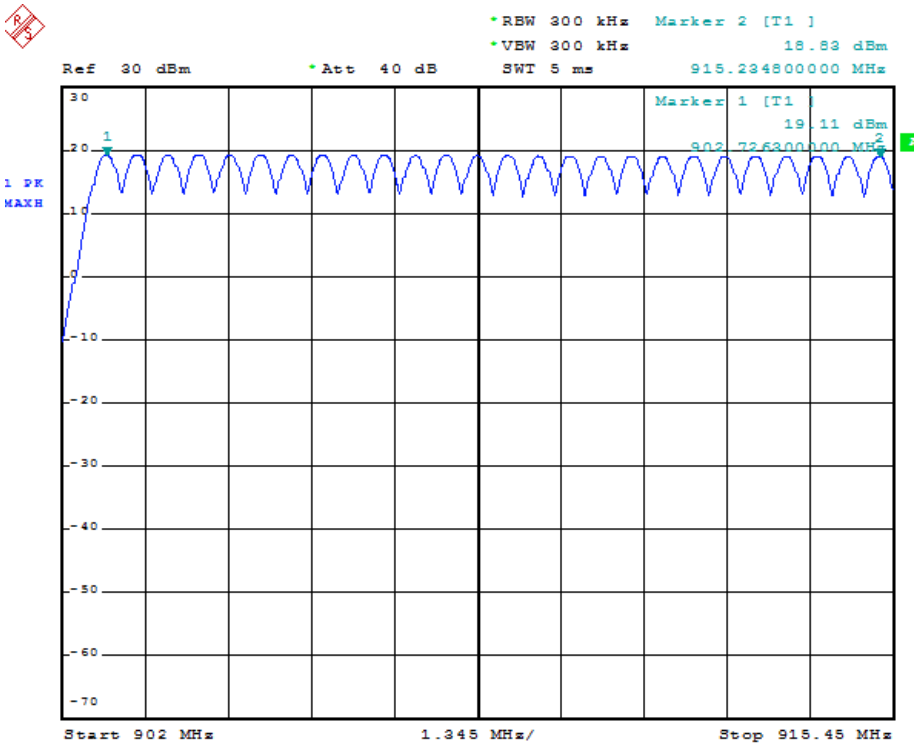
Hopping channel numbers	Limit	Test Result
50	≥50	Pass

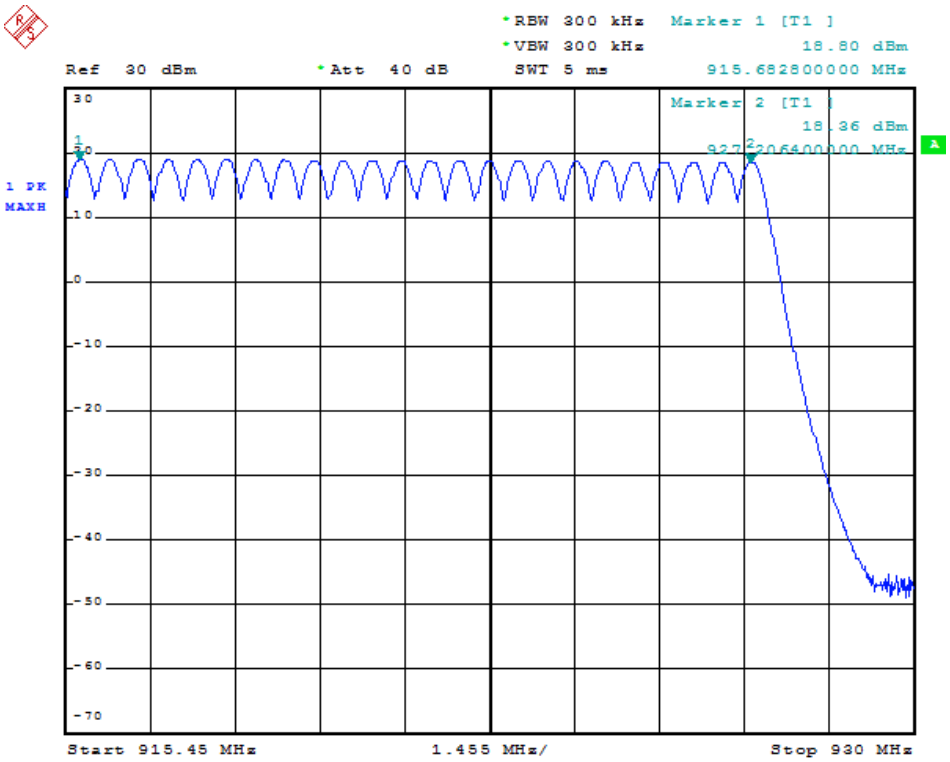
Test plot as follows:
Sequence 0



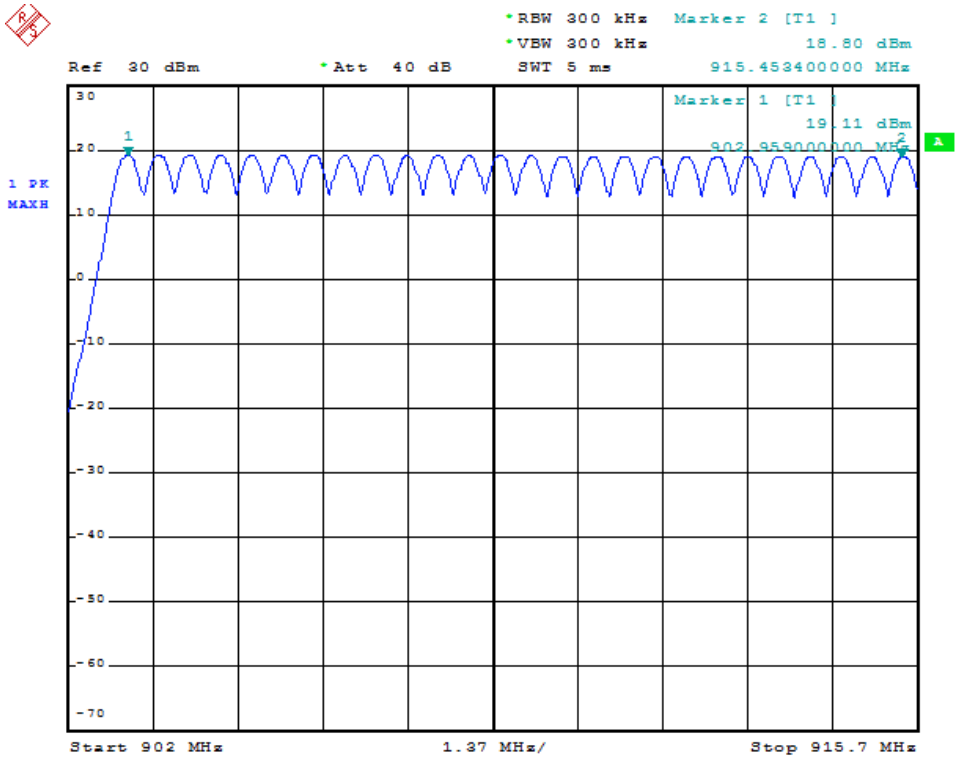


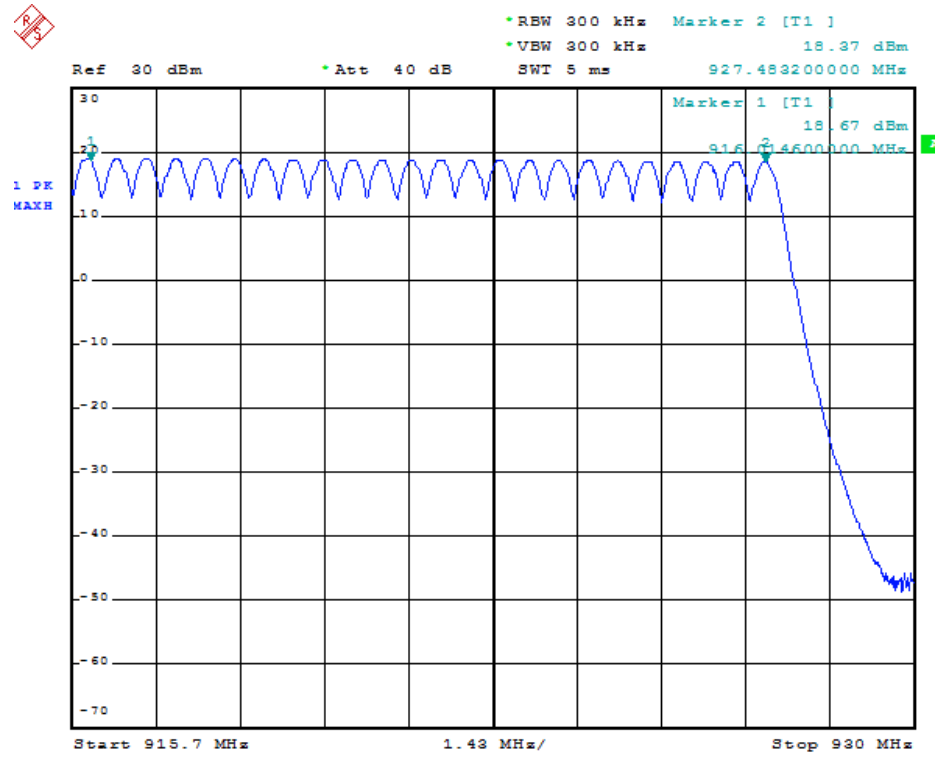
Sequence 4





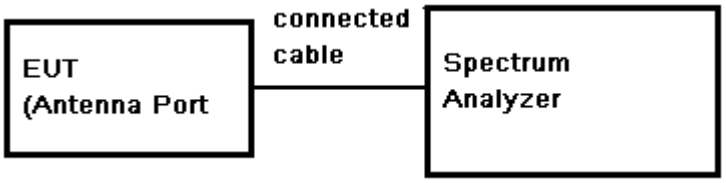
Sequence 9





6.9 Dwell Time

Test Configuration:



Test Procedure:

1) Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum. Keep EUT in Hopping transmitting with all kind of modulation.
2) Set spectrum analyzer span = 0. centered on a hopping channel;
3) Use Emission width * No. of Hopping Channels in 31.6s to determine the dwell time.

Limit:

Regulation 15.247(a)(1) (i) For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Test Data:

Sequence	Emission Width (ms)	Number of Hopping Channel in 20s	Average Occupancy Time (s)	Limit(s)	Test Result
0	114.8	2	0.2296	0.4	Pass
4	114.8	2	0.2296		Pass
9	114.8	2	0.2296		Pass

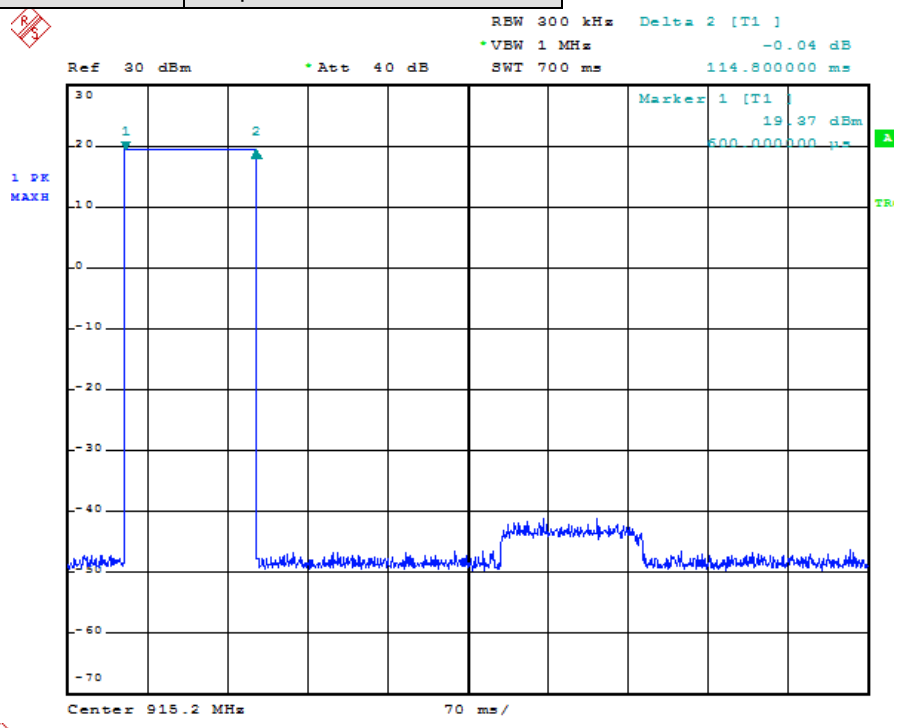
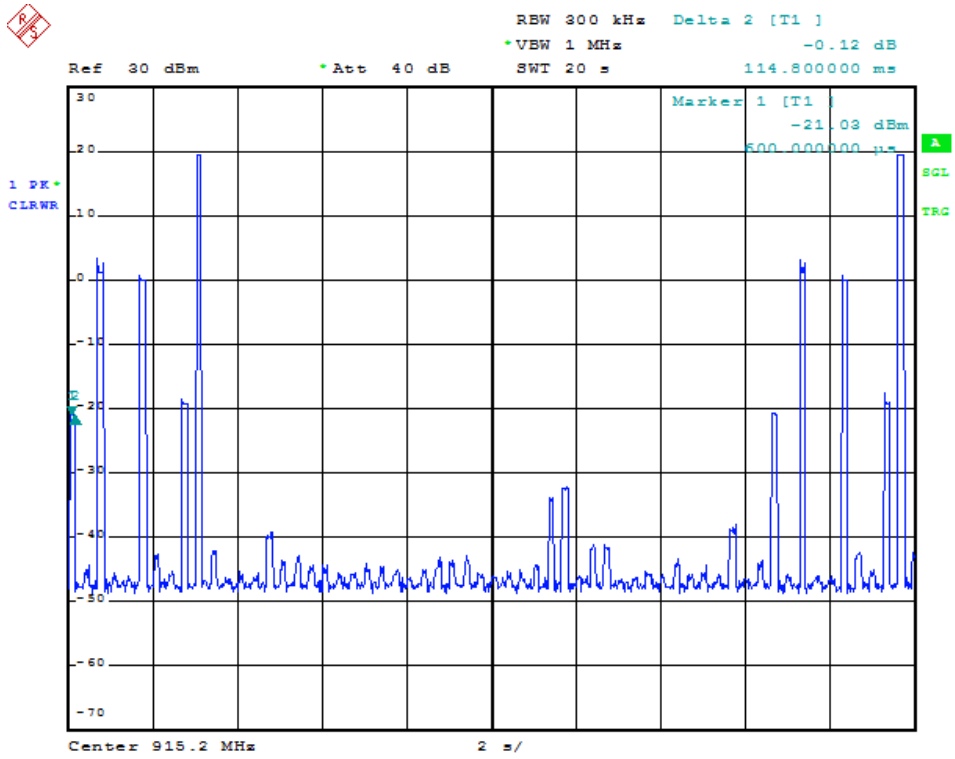
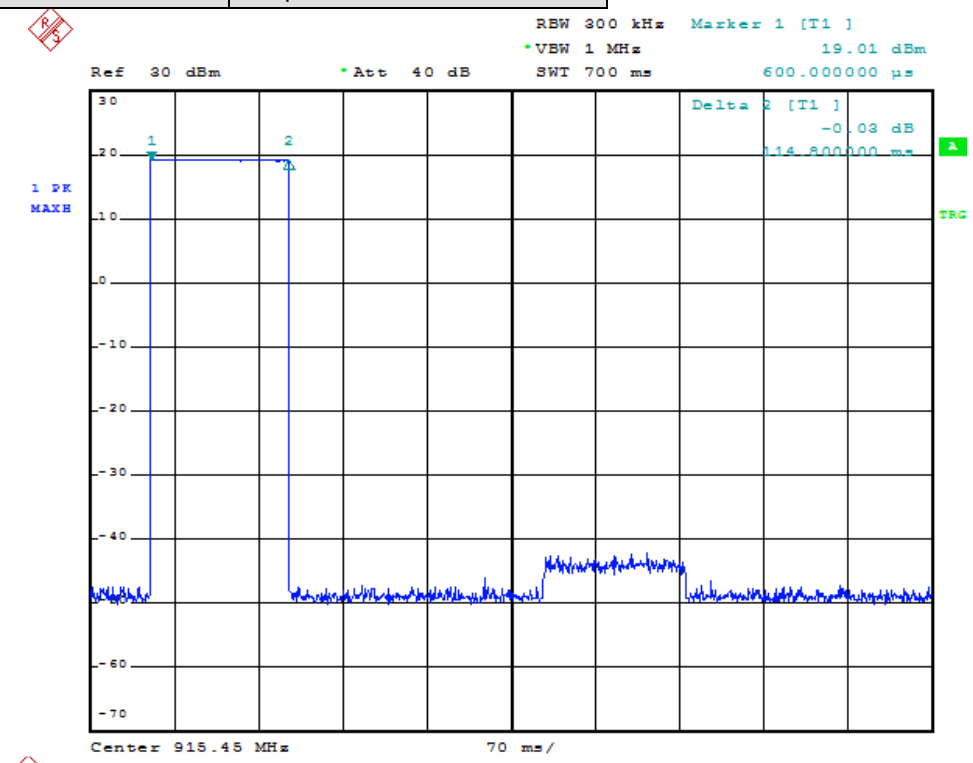
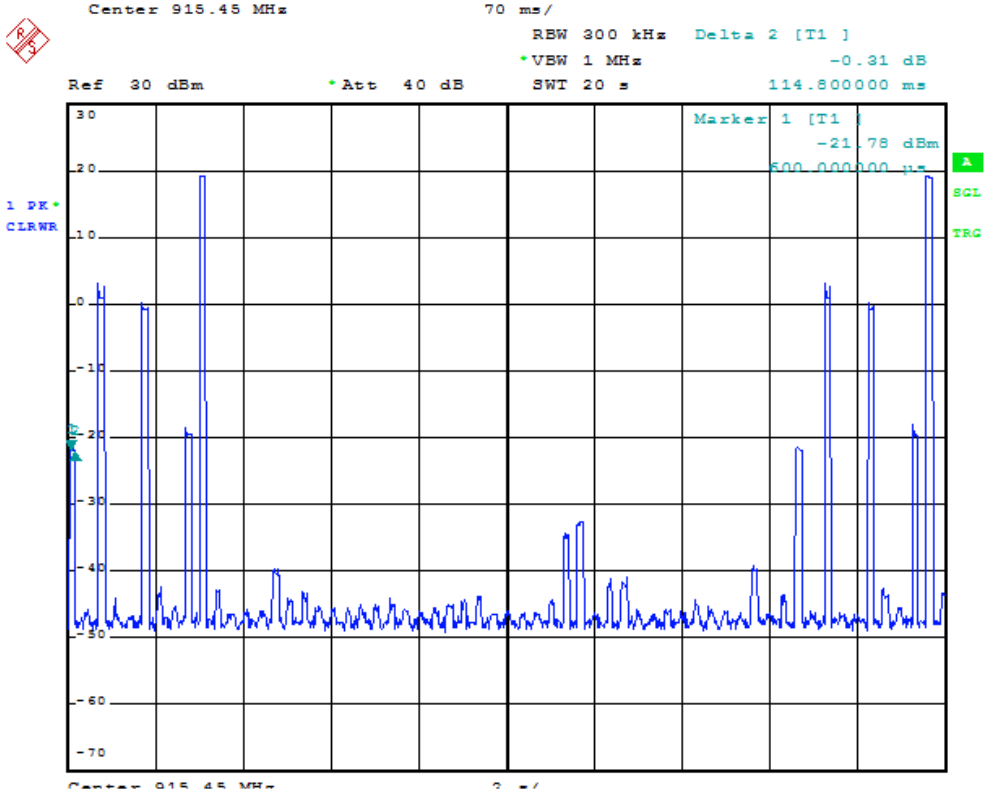
Test mode	Sequence 4





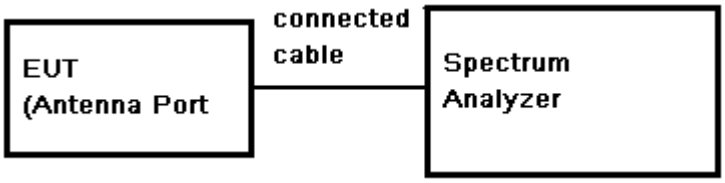
Test mode:DH5	Sequence 9





6.10 Conducted Spurious Emissions and Band-edge

Test Configuration:



Test Procedure: 1. Remove the antenna from the EUT and then connect a low RF cable from the antenna port to the spectrum.

2. Set the spectrum analyzer: RBW = 100KHz. VBW >= RBW. Sweep = auto; Detector Function = Peak (Max. hold).

Limit: (d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating. The radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Based on either an RF conducted or a radiated measurement. Provided the transmitter demonstrates compliance with the peak conducted power limits.

Test Result: Pass

6.11 Radiated Spurious Emissions and Band-edge

Frequency Range: 9KHz to 25GHz

Test site/setup: Measurement Distance: 3m (Semi-Anechoic Chamber)
Test instrumentation set-up:

Frequency Range	Detector	RBW	VBW
0.009MHz-0.090MHz	Peak	10kHz	30kHz
0.009MHz-0.090MHz	Average	10kHz	30kHz
0.090MHz-0.110MHz	Quasi-peak	10kHz	30kHz
0.110MHz-0.490MHz	Peak	10kHz	30kHz
0.110MHz-0.490MHz	Average	10kHz	30kHz
0.490MHz -30MHz	Quasi-peak	10kHz	30kHz
30MHz-1GHz	Quasi-peak	100kHz	300kHz
Above 1GHz	Peak	RBW=1MHz	VBW≥RBW
	Average		VBW=10Hz

Sweep=Auto

15.209 Limit:

Frequency	Limit (dBuV/m)
0.009MHz-0.490MHz	128.5 ~ 93.8
0.490MHz-1.705MHz	73.8 ~63.0
1.705MHz-30MHz	69.5
30MHz-88MHz	40.0
88MHz-216MHz	43.5
216MHz-960MHz	46.0
960MHz-1GHz	54.0
Above 1GHz	54.0

Note: 15.35(b), Unless otherwise specified, the limit on peak radio frequency emissions is 20dB above the maximum permitted average emission limit applicable to the equipment under test. This peak limit applies to the total peak emission level radiated by the device.

Test Configuration: Receive antenna scan height 1 m - 4 m. polarization Vertical / Horizontal

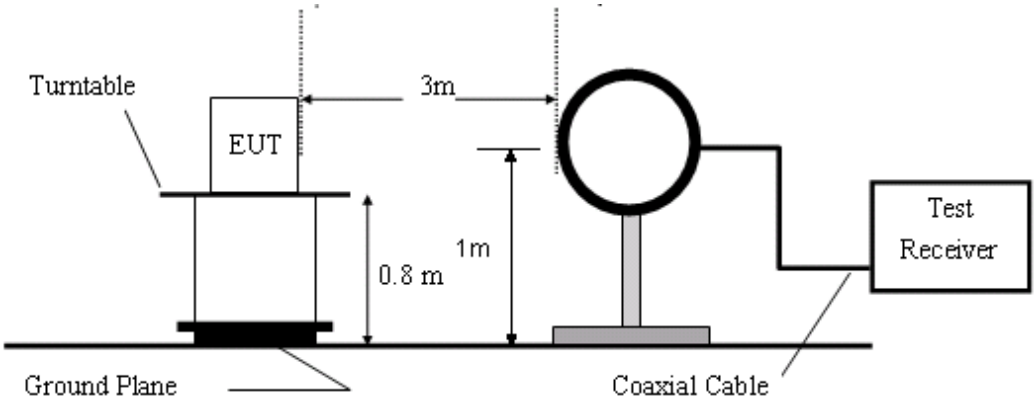

Figure1. Below 30MHz radiated emissions test configuration

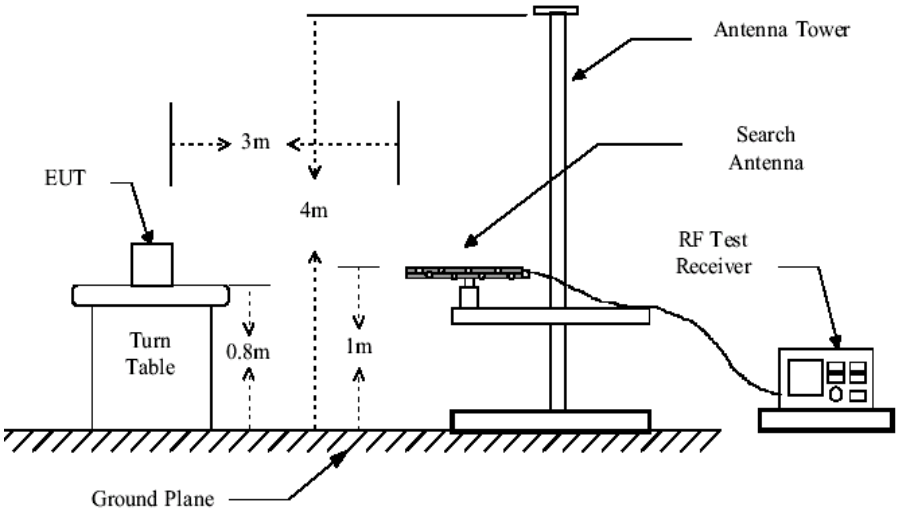

Figure2. 30MHz to 1GHz radiated emissions test configuration

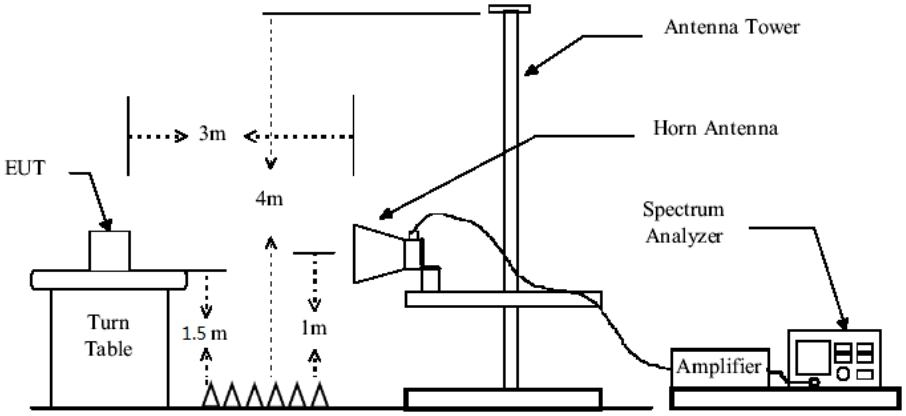

Figure3. Above 1GHz radiated emissions test configuration

Test Procedure:

1) The procedure used was ANSI Standard C63.10. The receiver was scanned from 9KHz to 25GHz.When an emission was found, the table was rotated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. The worst case emissions were reported.
2) Low noise amplifier was used below 1GHz, High pass Filter was used above 3GHz. Between 1G and 3GHz, we did not use any amplifier or filter.
3) Pre-test was performed on all modes, Compliance test was performed on worse case (GFSK mode).
   a) Below 30 MHz, Test were performed for their spatial orthogonal(X, Y, Z), the worst test data (X orthogonal) was submitted.
   b) For this intentional radiator operates below 25 GHz. the spectrum shall be investigated to the tenth harmonic of the highest fundamental frequency. And above the third harmonic of this intentional radiator, the disturbance is very low. So the test result only displays to 5rd harmonic.
   c) As shown in Section, for frequencies above 1000MHz. the above field strength limits are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.
4) No spurious emissions were detected within 20dB of limit below 30MHz.

Test Result: Pass
