4 Subject of Investigation

The objective of the measurements done by CETECOM Inc. was to assess the performance of the EUT per the relevant requirements specified in FCC rules Part 15.247 of Title 47 of the Code of Federal Regulations..

This test report is to support a request for new equipment authorization under the FCC ID: 2AIA7-SPN01

Testing procedures are based on ANSI 63.10 (2013) and "GUIDANCE FOR PERFORMING COMPLIANCE MEASUREMENTS ON DIGITAL TRANSMISSION SYSTEMS (DTS) OPERATING UNDER §15.247; April 8, 2016" by the Federal Communications Commission, Office of Engineering and Technology, Laboratory Division.

6 Measurements

6.1 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus, with 95% confidence interval (in dB delta to result), based on a coverage factor k=1.

| | Uncertainty in dB radiated <30MHz | Uncertainty in dB radiated 30MHz - 1GHz | Uncertainty in dB radiated > 1GHz | Uncertainty in dB Conducted measurement |
|---|---|---|---|---|
| standard deviation k=1 | 2.48 | 1.94 | 2.16 | 0.64 |
| 95% confidence interval in dB | 4.86 | 3.79 | 4.24 | 1.25 |
| 95% confidence interval in dB in delta to Result (rounded up to next decimal point) | | +/- 2.0 dB | +/- 2.3dB | +/- 0.7dB |

6.2 Environmental Conditions During Testing:

The following environmental conditions were maintained during the course of testing:

- Ambient Temperature: 20-25°C
- Relative humidity: 40-60%

6.3 Dates of Testing:

May 9, 2016 - August 29, 2016

6.4 Inheriting Test Results from Incorporated Module Certification:

The EUT integrates the certified module TI WL1835MOD (details see EUT spec in section 3.1)

Taking into account guidance from FCC KDB 996369 (modular approval) and where relevant test procedures did not change conducted test results are leveraged from the conducted test report for the TI WL1835MOD given by Sporton International Inc., dated January 27, 2014 with Report Reference Number: FR3N2752-01C; FCC ID: Z64-WL18SBMOD.

This test report contains full radiated testing as per FCC 15.247.

6.5 Additional Test Information

Testing is performed according to the guidelines provided in FCC publication (KDB) FCC KDB 558074 D01 V03R05, GUIDANCE FOR PERFORMING COMPLIANCE MEASUREMENTS ON DIGITAL TRANSMISSION SYSTEMS (DTS) OPERATING UNDER §15.247 and according to relevant parts of ANSI 63.10 as detailed below.

Due to the discrepancy of the conducted peak output power from the measurements and the module report (section 8.4), full testing was done on 802.11g mode.

7 **Measurement Procedures**

7.1 Radiated Measurement

The radiated measurement is performed according to:

ANSI C63.10 (2013)

- The exploratory measurement is accomplished by running sweeps at 1 and 4m antenna heights over the required frequency range with R&S Test-SW EMC32 for both antenna polarizations. During each frequency scan the turntable rotates by no more than 10 deg.
- The 10 highest emissions are selected with an automatic algorithm of EMC32 searching for peaks in the noise floor and ensuring that broadband signals are not selected multiple times.
- The maxima are then again maximized through a fine search in frequency domain, maximized in the 360deg range of the turntable, and maximized over antenna height between 1m and 4m and for positioning of the EUT.
- The above procedure is repeated for transmission low mid and high channel.
- In case there are no emissions above noise floor level only the maximum trace is reported as described above.
- The results are split up into up to 4 frequency ranges due to antenna bandwidth restrictions. A magnetic loop is used from 9 kHz to 30 MHz, a Biconilog antenna is used from 30 MHz to 1 GHz, and two different horn antennas are used to cover frequencies up to 40 GHz.

7.2 Sample Calculations for Field Strength Measurements

Field Strength is calculated from the Spectrum Analyzer/ Receiver readings, taking into account the following parameters:

- 1. Measured reading in dBµV
- 2. Cable Loss between the receiving antenna and SA in dB and
- 3. Antenna Factor in dB/m

All radiated measurement plots in this report are taken from a test SW that calculates the Field Strength based on the following equation:

FS $(dB\mu V/m)$ = Measured Value on SA $(dB\mu V)$ - Cable Loss (dB)+ Antenna Factor (dB/m)

Example:

| Frequency (MHz) | Measured SA (dBµV) | Cable Loss (dB) | Antenna Factor Correction (dB) | Field Strength Result (dBµV/m) |
|--------------------|-----------------------|--------------------|--------------------------------------|-----------------------------------|
| 1000 | 80.5 | 3.5 | 14 | 98.0 |

7.3 Power Line Conducted Measurement Procedure

8 Maximum Conducted Output Power Verification

8.1 Measurement Settings

Conducted RMS power measurements were taken according to ANSI C63.10-2013 Section 11.9.2.3.2, using a gated RF average power meter capable of 5 MS/s RMS measurements (Equipment number 19 in section 12).

Conducted Peak power measurements were taken according to ANSI C63.10-2013 Section 11.9.1.2, using a spectrum analyzer. (Equipment number 20 in section 16)

8.2 Limits:

- The measured RMS output power shall be within +0.2dB and -1dB from the modular report power.
- The power measured on the mid channel of each RF band of operation will be compared to the Max. Output Power from the modular report as indicated in section 6.4.

8.3 Test conditions and setup:

| Ambient Temperature | EUT Set-Up # | EUT operating mode | Power Input |

9.3 Test Procedure

Conducted Peak power measurements were taken according to ANSI C63.10-2013 Section 11.9.1.2, using a spectrum analyzer. (Equipment number 20 in section 16)

Due to the discrepancy of the conducted peak output power from the output power verification measurements and the module report (section 8.4), testing was done on all 802.11g mode channels.

For 802.11b mode, the test results from the module report were leveraged for compliance.

10 Power Spectral Density

10.1 Limits:

§ 15.247 (e)

For digitally modulated systems, the peak power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8dBm in any 3 kHz band during any time interval of continuous transmission.

10.2 Test Conditions:

| Ambient Temperature | EUT Set-Up # | EUT operating mode | Power Input |
|---------------------|--------------|--------------------|---------------|
| 23° C | 1 | Tx | 120 Vac 60 Hz |

10.3 Measurement procedure:

Conducted measurements were taken according to ANSI C63.10-2013 Section 11.10.2, using a spectrum analyzer. (Equipment number 20 in section 16)

Due to the discrepancy of the conducted peak output power from the output power verification measurements and the module report (section 8.4), testing was done on all 802.11g mode channels.

For 802.11b mode, the test results from the module report were leveraged for compliance.

(b) Except as provided in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in § 15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in § 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in § 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in § 15.35 apply to these measurements.

§15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

11.2 Measurement Procedure:

Conducted measurements were taken according to ANSI C63.10-2013 Section 11.11.1 for non restricted frequency bands and ANSI C63.10-2013 Section 11.12.2 for restricted frequency bands, using a spectrum analyzer (Equipment number 20 in section 16).

Due to the discrepancy of the conducted peak output power from the measurements and the module report (section 8.4), testing was done on all 802.11g mode channels.

For 802.11b mode, the test results from the module report were leveraged for compliance.

Since restricted band edge tests have been performed by the conducted method the measurements shown in the plots are adjusted by the duty cycle correction factor (RMS measurements only), Cable loss, External Attenuation and the declared maximum antenna gain for the comparison with the dBm value of the restricted band limits for 3m distance (peak = 74dBµV/m relates to -21.2 dBm; average = 54dBµV/m relates to -41.2 dBm).

Correction Factors (applied to measurement as offset):

Antenna Gain- 3.6 dBi External Attenuation- 9dB Cable Loss- 1.2 dB Duty Cycle Correction Factor (Section 11.5.1) - 0.6 dB

13 Radiated Transmitter Spurious Emissions and Restricted Bands

13.1 Measurement Settings

Measurement according to ANSI C63.10 (2013)

Analyzer Settings:

Frequency = 9 KHz – 30 MHz RBW = 9 KHz Detector: Peak

Frequency = 30 MHz – 1 GHz Detector = Peak / Quasi-Peak RBW=120 KHz (<1GHz)

Frequency > 1 GHz

For testing at distance other than the specified in the standard, the limit conversion is calculated by using 40 dB/decade extrapolation factors as follow:

Conversion factor (CF) = 40 log (D/d) = 40 log (300m / 3m) = 80dB

13.3 Test conditions and setup:

Please see section 7.1 for detailed test setup. Equipment numbers 1-16 in section 16 of this report were used for this test case in a semi-anechoic chamber.

Due to the discrepancy of the conducted peak output power from the measurements and the module report (section 8.4), full testing was done on all 802.11g mode channels.

For 802.11b mode, only mid channel was tested as the highest RMS output power in the module report referenced in section 6.4 was the mid channel for each technology.

14 AC Power Line Conducted Emissions

The purpose of this test is to measure unwanted radio frequency currents induced in any AC conductor external to the equipment which could conduct interference to other equipment via the AC electrical network.

14.1 Limits:

§15.207

(a) Except as shown in paragraphs (b) and (c) of this section of the CFR, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table (1), as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 1:

| F ((MIL) | Conducted limit (dBμV) | | | | | |
|-----------------------------|------------------------|-----------|--|--|--|--|
| Frequency of emission (MHz) | Quasi-peak | Average | | | | |
| 0.15–0.5 | 66 to 56* | 56 to 46* | | | | |
| 0.5–5 | 56 | 46 | | | | |
| 5–30 | 60 | 50 | | | | |

^{*}Decreases with the logarithm of the frequency.

14.2 Test conditions and setup:

Mid channel on 802.11b and the 802.11n radios were set according to section 3.4.

| Ambient Temperature | EUT Set-Up# | EUT operating mode | Power Input |
|---------------------|-------------|--------------------|--------------------|
| 23° C | 1 | Tx | AC/DC Power Supply |

14.3 Test Procedure:

Measurement according to ANSI C63.10:2013 section 6.2 and 4.1.

Equipment numbers 9, 17 in section 16 of this report were used for this test case.

Analyzer Settings:

RBW = 9 KHz (CISPR Bandwidth) **Detector:** Quasi-Peak / Average

Equipment used meets the measurement uncertainty requirements as required per applicable standards for 95% confidence levels. Calibration due dates, unless defined specifically, falls on the last day of the month.

Items indicated "N/A" for cal status either do not specifically require calibration or is internally characterized before use.
