#### **Description of EUT Operation:**

The Equipment Under Test (EUT) is a **INTERNATIONALTOY** of Remote Control Toy. It is a 1 switch transceiver and operating at 2412MHz to 2468MHz. The lowest, middle and highest frequencies were tested and the results are shown in the report. The EUT transmit while corresponding remote controller buttons is being pressed, Modulation by IC, and type is GFSK. There are total 57 channels and below is the frequency list :

2412	2413	2414	2415	2416	2417	2418	2419	2420	2421
2422	2423	2424	2425	2426	2427	2428	2429	2430	2431

2462	2463	2464	2465	2466	2467	2468			

The transceiver has different control:

1. ON/OFF switch – control power on/off

#### Antenna Requirement (Section 15.203)

The EUT is use of a permanently antenna. It is soldered on the PCB. The antenna consists of 2.8cm long wire The antenna is not replaceable or user serviceable. The requirements of S15.203 are met. There are no deviations or exceptions to the specifications.

## **Test Results**

### **Radiated Emissions (Fundamental)**

Test Requirement:	FCC Part 15 Section 15.249
Test Method:	ANSI C63.10
Test Date(s):	2020-02-27
Temperature:	21.0 °C
Humidity:	60.0 %
Mode of Operation:	Transmission mode
Tested Voltage:	6Vd.c.("AA" size battery x 4)

### **Test Procedure:**

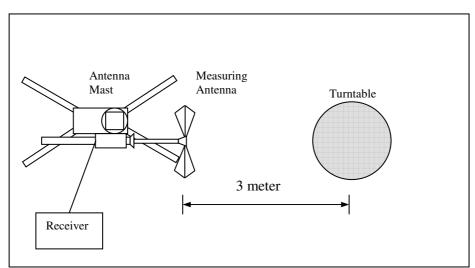

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.10 - 2013.

The equipment under test (EUT) was placed on a non-conductive turntable with dimensions of 1.5m x 1m and 0.8m high above the ground for measurement frequency below 1GHz and 1.5m high above the ground for measurement frequency above 1GHz. 3m from the EUT, a broadband antenna mounting on the mast received the signal strength. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, For battery operated equipment, the equipment tests shall be perform using new battery. The turntable was rotated to maximize the emission level. The antenna was then moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated.

For below 30MHz, a loop antenna with its vertical plane is place 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1m above the ground.

### Frequency range of Fundamental Emission

Test Requirement:	FCC 47 CFR 15.249
Test Method:	ANSI C63.10 Clause 6.10
Test Date(s):	2020-03-03
Temperature:	21.0 °C
Humidity:	61.0 %
Mode of Operation:	Transmission mode
Tested Voltage:	6Vd.c.("AA" size battery x 4)

#### Test Method:

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

### **Duty Cycle Correction During 100msec:**

Each function key sends a different series of characters, but each packet period (100msec) never exceeds a series of 4 pulses (1.449msec). Assuming any combination of short and long pulses maybe obtained due to encoding the worst case transmit duty cycle would be considered 4\*1.449 per 100msec = 5.796% duty cycle. Figure A show the characteristics of the pulse train for one of these functions

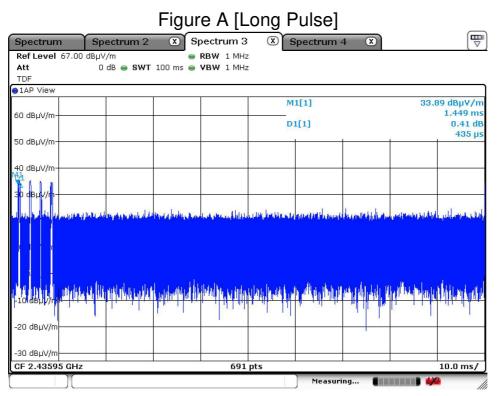

Remarks:

Duty Cycle Correction = 20Log(0.05796) = -24.7dB

The following figures [Figure A] show the characteristics of the pulse train for one of these functions.
