| (4) Meet 15.202 requirement - Yes , No , pls check below : A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an enabling signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the master. A device in client mode is not able to initiate a network. (5) For client devices that have software configuration control to operate in different modes (active scanning in some and passive scanning in others) in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies) or modular devices which configure the modes of operations through software, the application must provide software and operations description on how the software and / or hardware is implemented to ensure that proper operations modes can not | | | | | | | | | | | | | | | |
| be modified by end user Apply, No Apply (If apply, pls help to provide e The device configuration can r allow USB connection for user | / , explar not be whice | nation on l e modified ch is must | how it was I by user a to change | s prog the co | gram is no onfigurati | ot ex on. | posed to | o us | ser by any r | near | ns.
