1. Summary of Test Results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests.

The test results apply exclusively to the test samples as presented in this report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The presented Equipment Under Test(in this report, hereinafter referred as EUT) : **Vitoconnect OT2** supports following technologies : **2.4 GHz RF Transceiver Modes.**

EUT supported Technologies which are not tested within this test report

EUT supported Technology	Test Report Reference
ZigBee: 2405 – 2480 MHz	CETECOM-TR17-1-0060101T11a

EUT supported Technologies which are tested within this test report

- **WLAN 802.11b/g/n(HT20) Modes: 2412 – 2462 MHz (integrated precertified W224Z0-B4 | XAVi Module)**
-

Following test cases have been performed to show compliance with valid Part 15.205/15.207/15.209/15.247 of the FCC CFR Title 47 Rules, Edition 4th November 2016.

1.1. Tests Measurement Overview According to US CFR Title 47, Subpart 15C

Test cases	Port	References and Limits		EUT set-up	EUT op. mode	Result
		FCC Standard	Test limit			
Intentional Radiator → WLAN 802.11b/g/n(HT20) Modes: 2412 MHz– 2462 MHz						
Timing Of Transmitter (Pulsed Operation) + Duty Cycle	Antenna terminal (conducted)	§15.35 + ANSI C63.10:2013	No Limit Criteria	1	1	**PERFORMED** for Information only
6 dB Bandwidth	Antenna terminal (conducted)	§15.247(a)(2)	≥ 500 kHz for DTS systems	--	--	**NOT PERFORMED** Remark 1
99% Occupied Bandwidth	Antenna terminal (conducted)	2.1049(h)	99% Power bandwidth	--	--	**NOT PERFORMED** Remark 1
Transmitter Frequency Stability	Antenna terminal (conducted)	--	Operation within designated operational band	--	--	**NOT PERFORMED**
Transmitter Peak Output Power	Antenna terminal (conducted)	§15.247(b)(3)	1 W (Peak) (for Antenna Gain < 6 dBi)	1	1	**PASS**
Transmitter Peak Output Power EIRP	Antenna terminal (conducted + Antenna Gain	§15.247(b)(4)	< 4 Watt EIRP (for Antenna Gain < 6 dBi) if Antenna directional Gain > 6dBi reduction of Max. power by the amount in dB that the directional gain of the antenna exceeds 6 dBi	1	1	**PASS**
Power Spectral Density	Antenna terminal (conducted)	§15.247(e)	8dBm/3kHz Band (for Antenna Gain < 6 dBi) if Antenna directional Gain > 6dBi reduction of Max. power spectral density by the amount in dB that the directional gain of the antenna exceeds 6 dBi	1	1	**PASS**

Out-Of-Band RF- emissions + Band-Edge emissions	Antenna terminal (conducted)	§15.247 (d)	≥ 20 dBc/100 kHz Bandwidth	1	1	**PASS**
General field strength emissions within restricted bands + Band-Edge compliance radiated	Enclosure + Inter-connecting cables (radiated)	§15.247 (d)	≥ 20 dBc/100 kHz Bandwidth	2	1	**PASS**
		§15.205 + §15.209	Restricted band limits + General field strength limits			
AC-Power Lines Conducted Emissions	AC-Power lines or Battery Charger	§15.207(a)	AC Power line conducted limits	2	1	**PASS**

2. Administrative Data

2.1. Identification of the Testing Laboratory

Company name:	CETECOM GmbH
Address:	Im Teelbruch 116 45219 Essen - Kettwig Germany
Responsible for testing laboratory:	Dipl.-Ing. Rachid Acharkaoui
Deputy:	Dipl.-Ing. Niels Jeß

2.2. Test Location

2.2.1. Test laboratory "CTC"

Company name:	see chapter 2.1. Identification of the Testing Laboratory

2.3. Organizational Items

Responsible for test report and Project leader:	M.Sc. Ajit Phadtare
Receipt of EUT:	2017-07-26
Date(s) of test:	2017-08-05 to 2017-10-03
Date of report:	2017-10-09
Version of template: 13.02	

2.4. Applicant's Details

Applicant's name:	Viessmann Werke GmbH & Co. KG
Address:	Viessmannstraße 1 35108 Allendorf (Eder) GERMANY
Contact:	+49 (0) 6452 700

2.5. Manufacturer's Details

Manufacturer's name:	PRETTL Electronics GmbH
Address:	Robert-Bosch Str.10 01454 Radeberg GERMANY
Contact :	+49 (0) 3528 456 233

2.6. Responsible for Technical Tests

Company name:	ithinx GmbH
Address:	Butzweilerhof Allee 4 50829 Cologne GERMANY
Contact Person : Contact Details :	Mr. Jan Rüsen +49 (0) 221 99589 422 | jan.ruesen@ithinx.io

Cable number	Description	Connections	Cable length
Cable 1	--	--	--

4. Description of Test System Set-Up's

4.1. Test System Set-Up for Conducted Measurements on Antenna Port

Conducted Set-up W1

Conducted RF-Setup 1

General description:

The EUT's RF-signal is coupled out by a suitable antenna coupling connector (1). The signal is first attenuated (2) then connected to the power meter (3) for conducted power measurements. The specific attenuation loss is determined prior to the measurement within a set-up attenuation measurement. These are then taken into account by correcting the measurement readings.

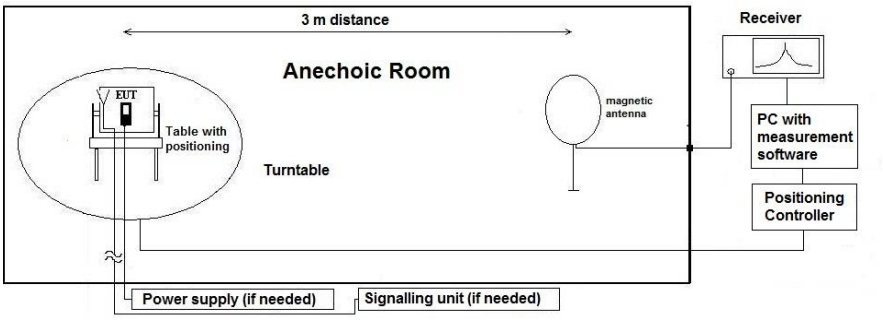
4.2. Test System Set-Up For Radiated Magnetic Field Measurements Below 30 MHz

Specification: ANSI C63.4-2014 §5.3, §8.2.1, §8.3.1.1+§8.3.2.1 , ANSI C63.10-2013 chapter 6.4 (§6.4.4.2)

General Description: Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed in the semi anechoic room recognized by the regulatory commission.

Schematic:



Testing method:

Exploratory, preliminary measurement
The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0°to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$

$M = L_T - E_C$

AF =Antenna factor
C_L = Cable loss
D_F= Distance correction factor
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A= Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

All units are dB-units, positive margin means value is below limit.

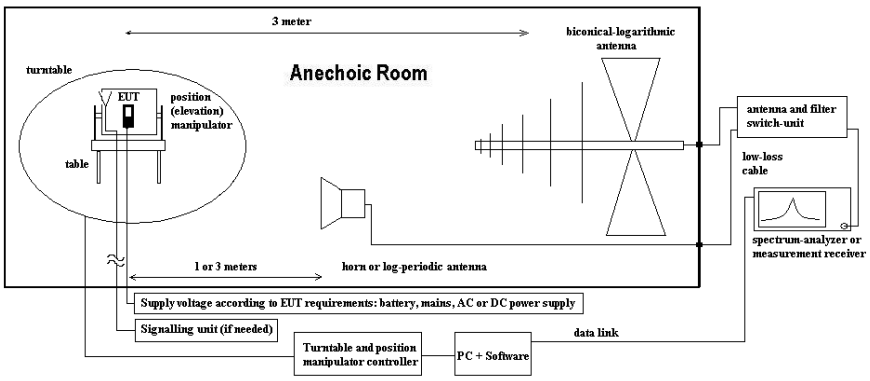
Distance correction: Reference for applied correction (extrapolating) factors due to reduced measurement distance:
ANSI C63.10:2013, §6.4.4.2 - Equations (2) + (3) + (4)

4.3. Test System Set-Up For Radiated Electric Field Measurement 30 MHz To 1 GHz

Specification: ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description: Evaluating the field emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the regulatory commissions.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 90°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semi-anechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A = Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

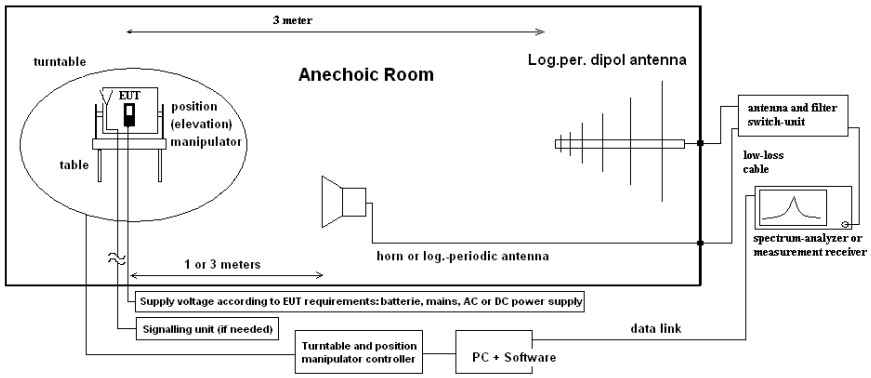
All units are dB-units, positive margin means value is below limit.

4.4. Test System Set-Up For Radiated Electric Field Measurement Above 1 GHz

Specification: ANSI C63.4-2014 chapter 8.3, ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4

General Description: Evaluating the emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.55 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 15°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.
The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined. Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out. On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

E_C = Electrical field – corrected value
E_R = Receiver reading
M = Margin
L_T = Limit
AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
G_A = Gain of pre-amplifier (if used)

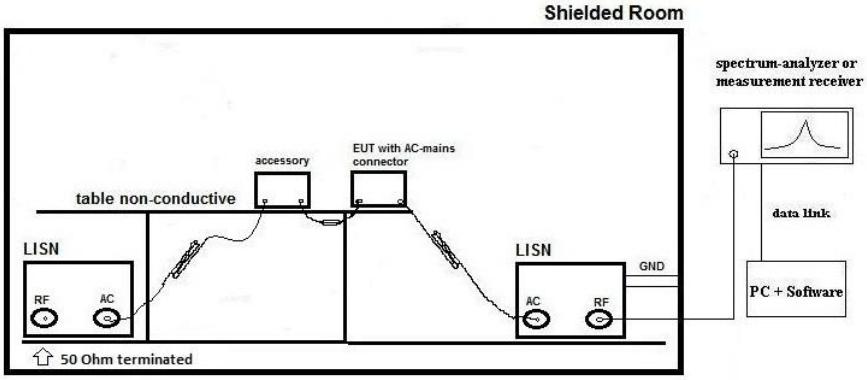
All units are dB-units, positive margin means value is below limit.

4.5. Test System Set-Up For AC Power-Line Conducted Emission Measurements

Specification: ANSI C63.4-2014 chapter 7, ANSI C63.10-2013chapter 6.2

General Description: The radio frequency voltage conducted back into the AC power line in the frequency range 150 kHz to 30 MHz has to be investigated. Compliance should be tested by measuring the radio frequency voltage between each power line and ground at the power terminals in the stated frequency range.
A 50 Ohm / 50 µH line impedance stabilization network (LISN) is used coupling the interface to the measurement equipment. The EUT power input leads are connected through the LISN to the AC-power source. The LISN enclosure is electrically connected to the ground plane. The measuring instrument is connected to the coaxial output of the LISN.
Tabletop devices were set-up on a 80 cm height above reference ground plane, floor standing equipment 10 cm raised above ground plane. Measurements have been performed on each phase line and neutral line of the devices AC-power lines. The EUT was power supplied with 110 V/60 Hz. The EUT was tested in the defined operating mode and installed (connected) to accessory equipment according the general description of use given by the applicant.

Schematic:



Only schematic view, we refer to figure 6, 7 and 8 of ANSI C63.4-2009 for more details.

Testing method: **Exploratory, preliminary measurements** as a first step, determines the worst-case phase line (neutral or phase) as well as the most critical operating mode of the equipment. A complete frequency-sweep with PK-Detector is performed on each current-carrying conductor.

Final testing for power phases and critical frequencies (Margin to AV- or QP limit lower than 3 dB) as a second step includes measurements with receivers detector set to Quasi-Peak and Average.

Formula:

$V_C = V_R + C_L$ (1)

$M = L_T - V_C$ (2)

V_C = measured Voltage –corrected value
V_R = Receiver reading
C_L = Cable loss
M = Margin
L_T = Limit

Values are in dB, positive margin means value is below limit.

Maximum Rated Conducted Output Power :	**Refer Chapter 3.3**	
Single Antenna Assembly Gain (G):	**4.32 dBi**	
Beamforming Gain (Y):	0 dBi	
Duty-Cycle Factor:	Near 100% (test purposes only)	

A special firmware program is used for test purposes. In contrast to normal operating mode a higher duty-cycle is set in order to facilitate the measurements. This is maximized at the extent possible.
The necessary duty-cycle correction factor is determined on nominal conditions on channel for all modes. It is assumed that no noticeable changes occur when tested on other channels or climatic conditions.

5.1.2. Duty-Cycle Results:

5.2.2. Requirements & Limits:

FCC	☒ §15.247(b) (3) (4)
ANSI	☒ C63.10-2013
KDB Guidance no.	☒ KDB 558074 D01 DTS Meas.Guidance v04 ☐ KDB 662911 D01 Multiple Transmitter Output v02r01 (MIMO, Smart-antenna)
Limits	☒ **Frequency Band 2400-2483.5 MHz** ☒ **Digital Modulation Techniques System:** **maximum conducted power shall not exceed 1 W if Antenna Gain < 6 dBi** if Antenna Gain > 6 dBi maximum conducted output power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi if MIMO Antennas: directional Antenna Array Gain = 10 log (No. Antennas) + Highest Antenna Gain amongst total Antennas

5.2.3. RF Peak Output Power Verification- WLAN 2.4 GHz b/g/n(HT20)/n(HT40) Modes

For each mode data rate giving Maximum output power (Worst Case) have been found using Pre-Certified Module **W224Z0-B4 (FCC ID:RYU-W224Z0)**.

Refer **W224Z0YYYYY | XAVi Module| Report No: FR5N0423-02,Rev.02 issue date May 05,2017**|Sporton International Inc.

The measurements are then performed with these Maximum output power (Worst Case) Data rates with TX Chain 1 Only. (TX Chain 2 is not implemented in Vitoconnect OT2)

Worst Case Data Rate b Mode → 1 Mbps → TX Chain: 1

Worst Case Data Rate g Mode → 6 Mbps→ TX Chain: 1

Worst Case Data Rate n(HT20)→ MCS0 → TX Chain: 1

Worst Case Data Rate n(HT40)→ MCS0 → TX Chain: 1

5.4.5. Correction factors due to reduced meas. distance (f< 30 MHz)

The used correction factors when the measurement distance is reduced compared to regulatory measurement distance, are calculated according Extrapolation formulas valid for EUT's with maximum dimension of 0.625xLambda. Formula 2+3+4 as presented in ANSI C63.10, Chapter 6.4.4 are used for the calculations of proper extrapolation factors.

Frequency -Range	f [kHz/MHz]	Lambda [m]	Far-Field Point [m]	Distance Limit accord. 15.209 [m]	1st Condition (dmeas< $D_{near-field}$)	2'te Condition (Limit distance bigger $d_{near-field}$)	Distance Correction accord. Formula

General measurement procedures		Please see chapter "Test system set-up for radiated electric field measurements above 1 GHz" for general measurements procedures in anechoic chamber.		

5.7.4. Radiated Band-Edge Measurement Method

For uncritical results where a measurement resolution bandwidth of 1MHz can clearly show the compliance without influencing the results, a field strength measurement was performed to show compliance.

For critical results a Marker-Delta marker method was used for showing compliance to restricted bands. The method is according ANSI C63.10:2013, Chapter 6.10.6 "Marker-Delta method",. The method consists of three independent steps:

1. Step: Prior to the measurement the fundamental radiated In-Band field strength was performed. The determined value is used as reference value.

2. Step: Second step consist of finding the relative attenuation between the fundamental emission and the maximum local out-of-band emission (within 2 MHz range around the band edge either on the band-edge directly or some modulation product if the level is greater than that on the band-edge) when measured with lower resolution bandwidth.

3. Step: The delta value recorded in step 2 will be subtracted from value recorded in step 1, thus giving the required field strength at the band-edge. This value must fulfil the requirements for radiated spurious emissions in restricted bands in FCC §15.205 with the general limits of FCC §15.209.

5.7.5. Radiated Band-Edge Results:

5.7.5.1. Non-Restricted Bands Near-By Limits According to FCC §15.247

Test Settings:	**Technology: WLAN 2.4 GHz 802.11b/g/n**	**TX-Fixed Channel (Modulated)**
Test Conditions:	T_{NOM}= 20 °C	V_{NOM}= 12 V DC (using AE 1)
Set-up No.:	2

5.9. Measurement Uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor **k**, such that a confidence level of approximately 95% is achieved.
For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Calculated uncertainty based on a confidence level of 95%						Remarks
Conducted emissions (U_{CISPR})	CISPR 16-2-1	9 kHz - 150 kHz 150 kHz - 30 MHz	4.0 dB 3.6 dB						-
Radiated emissions Enclosure	CISPR 16-2-3	30 MHz - 1 GHz 1 GHz - 18 GHz	4.2 dB 5.1 dB						E-Field
Disturbance power	CISPR 16-2-2	30 MHz - 300 MHz	-						-

8.1.3. Legend

Note / remarks		**Calibrated during system calibration:**
	1a	System CTC-SAR-EMS (Ref.-No. 442)
	1b	System-CTC-EMS-Conducted (Ref.-No. 335)
	1c	System CTC-FAR-EMI-RSE (Ref.-No . 443)
	1d	System CTC-SAR-EMI (Ref.-No . 441)
	1e	System CTC-OATS (EMI radiated) (Ref.-No. 337)
	1 f	System CTC-CTIA-OTA (Ref.-No . 420)
	1 g	System CTC-FAR-EMS (Ref.-No . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months. between this every 12 months internal validation
	36/12 M	Calibration every 36 months. between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	-	Without calibration
