## 1 APPLIED STANDARDS AND TEST SUMMARY

### 1.1 APPLIED STANDARDS

#### Type of Authorization

Certification for an Intentional Radiator.

#### **Applicable FCC Rules**

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 and 15 (10-1-20 Edition). The following subparts are applicable to the results in this test report.

- Part 2, Subpart J Equipment Authorization Procedures, Certification
- Part 15, Subpart C Intentional Radiators
- § 15.201 Equipment authorization requirement
- § 15.207 Conducted limits
- § 15.209 Radiated emission limits; general requirements
- § 15.247 Operation within the bands 902-928 MHz, 2400-2483.5 MHz

Note:

The tests were selected and performed with reference to the FCC Public Notice "Guidance for Compliance Measurements on Digital Transmission System, Frequency Hopping Spread Spectrum System, and Hybrid System Devices Operating under Section 15.247 of the FCC Rules, 558074 D01 15.247 Meas Guidance v05r02, 2019-04-02". ANSI C63.10-2013 is applied.

## 1.2 FCC-IC CORRELATION TABLE

## Correlation of measurement requirements for DTS (BT LE) equipment from FCC and IC

#### **DTS equipment**

| Measurement                                 | FCC reference                 | IC reference   |
|---|-------------------------------|--|
| Conducted emissions on AC<br>Mains          | § 15.207                      | RSS-Gen Issue 5: 8.8   |
| Occupied bandwidth                          | § 15.247 (a) (2)              | RSS-247 Issue 2: 5.2 (a)                                     |
| Peak conducted output power                 | § 15.247 (b) (3), (4)         | RSS-247 Issue 2: 5.4 (d)                                     |
| Transmitter spurious RF conducted emissions | § 15.247 (d)                  | RSS-Gen Issue 5: 6.13 /<br>8.9/8.10;<br>RSS-247 Issue 2: 5.5 |
| Transmitter spurious radiated emissions     | § 15.247 (d);<br>§ 15.209 (a) | RSS-Gen Issue 5: 6.13 /<br>8.9/8.10;<br>RSS-247 Issue 2: 5.5 |
| Band edge compliance                        | § 15.247 (d)                  | RSS-247 Issue 2: 5.5   |
| Power density                               | § 15.247 (e)                  | RSS-247 Issue 2: 5.2 (b)                                     |
| Antenna requirement                         | § 15.203 / 15.204             | RSS-Gen Issue 5: 8.3   |
| Receiver spurious emissions                 | -                             | -  |

COMMENT: -

The EUT is already full tested. Due to a HW change only spot-checks measurement are performed.

Please refer to the reference report MDE\_SKF\_1903\_FCC\_01.

## 4 TEST OBJECT DATA

## 4.1 GENERAL EUT DESCRIPTION

| Kind of Device product description           | FOR WEM2.0: Bearing failure detection (vibrations) Wheel end Temperature measurement                                       |
|--|--|
| Product name                                 | WEM-200  |
| Туре   | WEM-200 & Pilot parts  |
| Declared EUT data by                         | the supplier   |
| Voltage Type                                 | DC ( internal Battery)   |
| Voltage Level                                | 3 V  |
| Antenna / Gain                               | Integral / -2.8 dBi  |
| Tested Modulation Type                       | GFSK 1 Mbps  |
| Specific product<br>description for the EUT  | The device is a Bluetooth Low Energy transceiver operating in the 2.4 GHz ISM band. It supports 1 Mbps transmit rate only. |
| EUT ports (connected cables during testing): | -  |
| Tested datarates                             | 1 Mbit/s   |
| Special software used for testing            | Automation explorer (provided by 7layers)  |

## 4.2 EUT MAIN COMPONENTS

| Sample Name      | Sample Code             | Description     |

NOTE: The short description is used to simplify the identification of the EUT in this test report.

#### 4.3 ANCILLARY EQUIPMENT

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

| Device | Details<br>(Manufacturer, Type Model, OUT<br>Code) | Description |
|--------|--|-------------|
| -      | -  | -           |

#### 4.4 AUXILIARY EQUIPMENT

For the purposes of this test report, auxiliary equipment is defined as equipment which is used temporarily to enable operational and control features especially used for the tests of the EUT which is not used during normal operation or equipment that is used during the tests in combination with the EUT but is not subject of this test report. It is necessary to configure the system in a typical fashion, as a customer would normally use it.

But nevertheless Auxiliary Equipment can influence the test results.

| Device | Details<br>(Manufacturer, Type Model, HW,<br>SW, S/N) | Description |
|--------|---|-------------|
| -      | -   | -           |

#### 4.5 EUT SETUPS

This chapter describes the combination of EUTs and equipment used for testing. The rationale for selecting the EUTs, ancillary and auxiliary equipment and interconnecting cables, is to test a representative configuration meeting the requirements of the referenced standards.

| Setup    | Combination of EUTs | Description and Rationale       |
|----------|---------------------|---------------------------------|
| S01_BA02 | EUT BA,             | Setup for radiated measurement  |
| S01_BB02 | EUT BB,             | Setup for conducted measurement |
| S01_BC02 | EUT BC,             | Setup for radiated measurement  |

## 4.6 OPERATING MODES / TEST CHANNELS

This chapter describes the operating modes of the EUTs used for testing.

| BT LE Test Channels: |

## 4.7 PRODUCT LABELLING

### 4.7.1 FCC ID LABEL

Please refer to the documentation of the applicant.

4.7.2 LOCATION OF THE LABEL ON THE EUT Please refer to the documentation of the applicant.

## 5 TEST RESULTS

### 5.1 OCCUPIED BANDWIDTH (6 DB)

#### Standard FCC Part 15 Subpart C

#### The test was performed according to: ANSI C63.10 Section 11.8.1

## 5.1.1 TEST DESCRIPTION

The Equipment Under Test (EUT) was set up to perform the occupied bandwidth measurements.

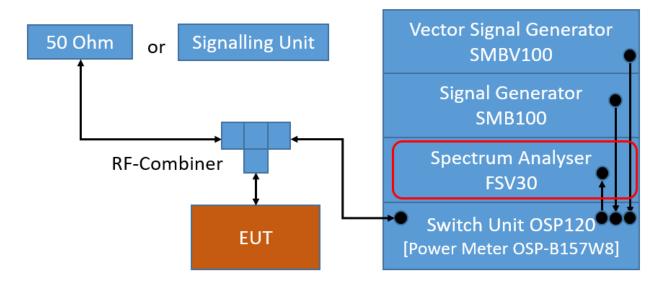

The reference level is the level of the highest amplitude signal observed from the transmitter at either the fundamental frequency or first-order modulation products in all typical modes of operation, including the unmodulated carrier, even if atypical.

The results recorded were measured with the modulation which produce the worst-case (smallest) emission bandwidth.

The EUT was connected to the test system as described in the block diagram below. The complete attenuation of the measurement path is known and considered.

Analyser settings:

- Resolution Bandwidth (RBW): 100 kHz
- Video Bandwidth (VBW): 300 kHz
- Span: Two times nominal bandwidth
- Trace: Maxhold
- Sweeps: Till stable (min. 500, max. 15000)
- Sweeptime: Auto
- Detector: Peak

TS8997; Channel Bandwidth

## 5.1.2 TEST REQUIREMENTS / LIMITS

### FCC Part 15, Subpart C, §15.247 (a) (2)

Systems using digital modulation techniques may operate in the 902-928 MHz and 2400-2483.5 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

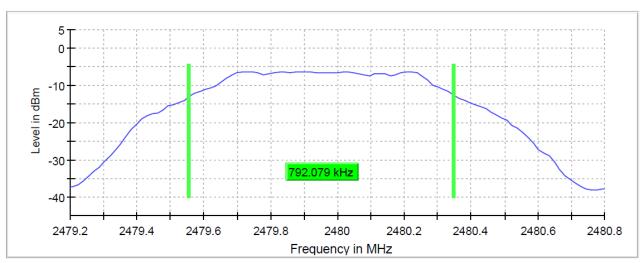

## 5.1.3 TEST PROTOCOL

| Ambient temperature:<br>Air Pressure:<br>Humidity:<br>BT LE 1 Mbit/s | 24 °C<br>1002 hPa<br>38 % |                 |                         |                |                          |

Remark: Please see next sub-clause for the measurement plot.

# 5.2.4 MEASUREMENT PLOT (EXAMPLE PLOT, SHOWING WORST CASE, IF APPLICABLE)

99 % Bandwidth

5.2.5 TEST EQUIPMENT USED - R&S TS8997

#### 5.3 PEAK POWER OUTPUT

#### Standard FCC Part 15 Subpart C

#### The test was performed according to:

ANSI C63.10 Section 11.9.1.3

### 5.3.1 TEST DESCRIPTION

#### DTS EQUIPMENT:

The Equipment Under Test (EUT) was set up to perform the output power measurements. The results recorded were measured with the modulation which produces the worst-case (highest) output power.

Maximum peak conducted output power (e.g. Bluetooth Low Energy):

The EUT was connected to the test system as described in the block diagram below. The complete attenuation of the measurement path is known and considered. The reference level of the spectrum analyser was set higher than the output power of the EUT.

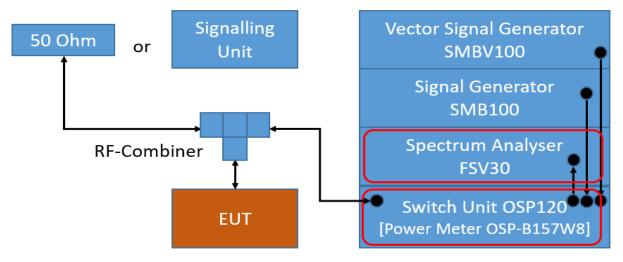

Analyser settings:

- Resolution Bandwidth (RBW): 2 MHz
- Video Bandwidth (VBW): 10 MHz
- Span: 6 MHz
- Trace: Maxhold
- Sweeps: 101
- Sweeptime: 1 ms
- Detector: Peak

Maximum conducted average output power (e.g. WLAN):

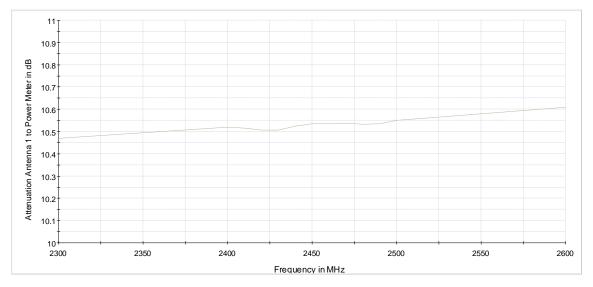

The EUT was connected to the test system as described in the block diagram below. The complete attenuation of the measurement path is known and considered.

Measurement is performed using the gated RF average power meter integrated in the OSP 120 module OSP-B157W8 with signal bandwidth >300 MHz.

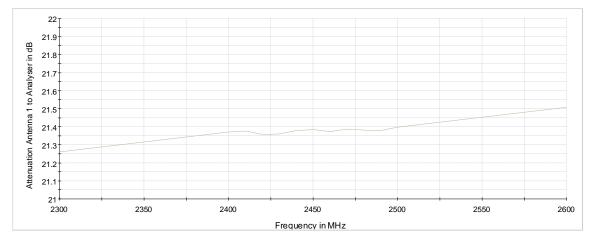

Attenuation of the measurement path to Power Meter

Attenuation of the measurement path to Analyser

## 5.3.2 TEST REQUIREMENTS / LIMITS

#### **DTS devices:**

FCC Part 15, Subpart C, §15.247 (b) (3) For systems using digital modulation techniques in the 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz bands: 1 watt.

==> Maximum conducted peak output power: 30 dBm (excluding antenna gain, if antennas with directional gains that do not exceed 6 dBi are used).

### **Frequency Hopping Systems:**

FCC Part 15, Subpart C, §15.247 (b) (1)

For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.

### FCC Part 15, Subpart C, §15.247 (b) (2)

For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels, as permitted under paragraph (a)(1)(i) of this section.

Used conversion factor: Limit (dBm) =  $10 \log (\text{Limit (W)}/1\text{mW})$ 

## 5.3.3 TEST PROTOCOL

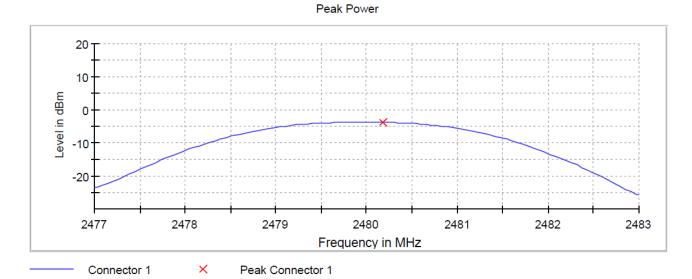

| Ambient temperature: | 24 °C    |

Remark: Please see next sub-clause for the measurement plot.

## 5.3.4 MEASUREMENT PLOT (EXAMPLE PLOT, SHOWING WORST CASE, IF APPLICABLE)

#### BT LE 4.2 GFSK Ch 39

### 5.3.5 TEST EQUIPMENT USED

- R&S TS8997

## 5.4 TRANSMITTER SPURIOUS RADIATED EMISSIONS

#### Standard FCC Part 15 Subpart C

## The test was performed according to:

ANSI C63.10

## 5.4.1 TEST DESCRIPTION

The test set-up was made in accordance to the general provisions of ANSI C63.10 in a typical installation configuration. The measurements were performed according the following sub-chapters of ANSI C63.10:

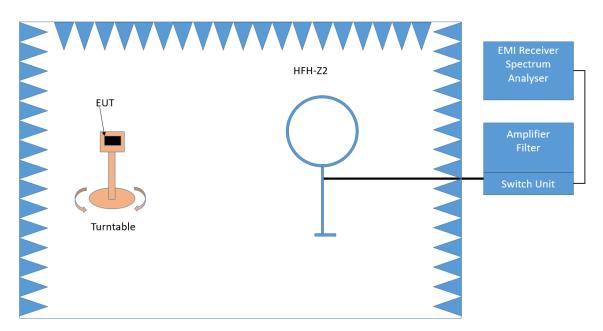

- < 30 MHz: Chapter 6.4
- 30 MHz 1 GHz: Chapter 6.5
- > 1 GHZ: Chapter 6.6 (procedure according 6.6.5 used)

The measurement procedure is implemented into the EMI test software EMC32 from R&S. Exploratory tests are performed at 3 orthogonal axes to determine the worst-case orientation of a body-worn or handheld EUT. The final test on all kind of EUTs is also performed at 3 axes. A pre-check is performed while the EUT is powered.

#### Below 1 GHz:

The Equipment Under Test (EUT) was set up on a non-conductive table in the semi-anechoic chamber. The influence of the EUT support table that is used between 30-1000 MHz was evaluated.

#### 1. Measurement up to 30 MHz

Test Setup; Spurious Emission Radiated (SAC), 9 kHz – 30 MHz

The Loop antenna HFH2-Z2 is used.

#### Step 1: pre measurement

TEST REPORT REFERENCE: MDE\_SKF\_2103\_FCC\_01\_rev01

- Anechoic chamber
- Antenna distance: 3 m
- Antenna height: 1 m
- Detector: Peak-Maxhold
- Frequency range: 0.009 0.15 MHz and 0.15 30 MHz
- Frequency steps: 0.05 kHz and 2.25 kHz
- IF-Bandwidth: 0.2 kHz and 9 kHz
- Measuring time / Frequency step: 100 ms (FFT-based)

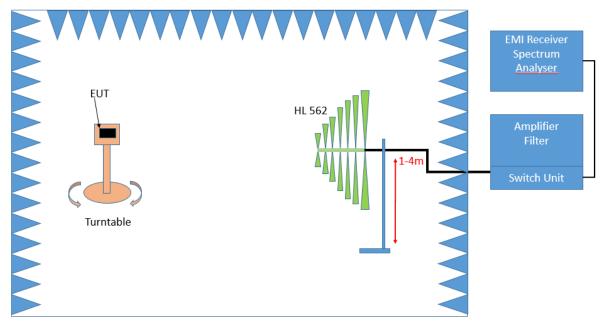

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

#### Step 2: final measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is to find the maximum emission level.

- Detector: Quasi-Peak (9 kHz 150 kHz, Peak / Average 150 kHz- 30 MHz)
- Frequency range: 0.009 30 MHz
- Frequency steps: measurement at frequencies detected in step 1
- IF-Bandwidth: 0.2 10 kHz
- Measuring time / Frequency step: 1 s

### 2. Measurement above 30 MHz and up to 1 GHz

Test Setup; Spurious Emission Radiated (SAC), 30 MHz- 1GHz

#### Step 1: Preliminary scan

This is a preliminary test to identify the highest amplitudes relative to the limit. Settings for step 1:

- Antenna distance: 3 m
- Detector: Peak-Maxhold / Quasipeak (FFT-based)
- Frequency range: 30 1000 MHz
- Frequency steps: 30 kHz
- IF-Bandwidth: 120 kHz
- Measuring time / Frequency step: 100 ms
- Turntable angle range: -180° to 90°
- Turntable step size: 90°

- Height variation range: 1 – 4 m

- Height variation step size: 1.5 m
- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

#### **Step 2:** Adjustment measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will slowly vary by  $\pm$  45° around this value. During this action, the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position, the antenna height will also slowly vary by  $\pm$  100 cm around the antenna height determined. During this action, the value of emission is also continuously measured. The highest emission will also be recorded and adjusted.

- Detector: Peak Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range: 360 °
- Height variation range:1 4 m
- Antenna Polarisation: max. value determined in step 1

#### **Step 3:** Final measurement with QP detector

With the settings determined in step 2, the final measurement will be performed: EMI receiver settings for step 3:

- Detector: Quasi-Peak (< 1 GHz)
- Measured frequencies: in step 1 determined frequencies
- IF Bandwidth: 120 kHz
- Measuring time: 1 s

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

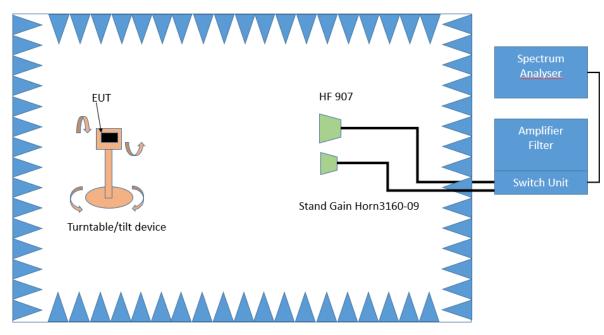

#### Above 1 GHz:

The Equipment Under Test (EUT) was set up on a non-conductive support (tilt device) at 1.5 m height in the fully-anechoic chamber.

All steps were performed with one height (1.5 m) of the receiving antenna only.

#### 3. Measurement above 1 GHz

Test Setup; Spurious Emission Radiated (FAC), 1 GHz-26.5 GHz

### Step 1:

The EUT is turned during the preliminary measurement across the elevation axis, with a step size of 90 °.

The turn table step size (azimuth angle) for the preliminary measurement is 45 °. Spectrum analyser settings:

- Detector: Peak, Average
- RBW = 1 MHz
- VBW = 3 MHz

### Step 2:

The turn table azimuth will slowly vary by  $\pm 22.5^{\circ}$ . The elevation angle will slowly vary by  $\pm 45^{\circ}$ Spectrum analyser settings: - Detector: Peak

#### Step 3:

- Spectrum analyser settings for step 3:
- Detector: Peak / CISPR Average
- Measured frequencies: in step 1 determined frequencies
- RBW = 1 MHz
- VBW = 3 MHz
- Measuring time: 1 s

## 5.4.2 TEST REQUIREMENTS / LIMITS

#### FCC Part 15, Subpart C, §15.247 (d)

... In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

FCC Part 15, Subpart C, §15.209, Radiated Emission Limits

| Frequency in MHz | Limit (µV/m)     | Measurement<br>distance (m) | Limits (dBµV/m)    |
|------------------|------------------|-----------------------------|--------------------|
| 0.009 - 0.49     | 2400/F(kHz)@300m | 3                           | (48.5 - 13.8)@300m |
| 0.49 - 1.705     | 24000/F(kHz)@30m | 3                           | (33.8 - 23.0)@30m  |
| 1.705 - 30       | 30@30m           | 3                           | 29.5@30m           |

The measured values are corrected with an inverse linear distance extrapolation factor (40 dB/decade) according FCC 15.31 (2).

| Frequency in MHz | Limit (µV/m) | Measurement<br>distance (m) | Limits (dBµV/m) |
|------------------|--------------|-----------------------------|-----------------|
| 30 - 88          | 100@3m       | 3                           | 40.0@3m         |
| 88 - 216         | 150@3m       | 3                           | 43.5@3m         |
| 216 - 960        | 200@3m       | 3                           | 46.0@3m         |
| 960 - 26000      | 500@3m       | 3                           | 54.0@3m         |
| 26000 - 40000    | 500@3m       | 1                           | 54.0@3m         |

The measured values above 26 GHz are corrected with an inverse linear distance extrapolation factor (20 dB/decade).

§15.35(b) ..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit....

Used conversion factor: Limit  $(dB\mu V/m) = 20 \log (Limit (\mu V/m)/1\mu V/m)$

## 5.4.5 TEST EQUIPMENT USED

- Radiated Emissions FAR 2.4 GHz FCC
- Radiated Emissions SAC up to 1 GHz
- Radiated Emissions SAC H-Field

## 5.5 BAND EDGE COMPLIANCE CONDUCTED

### Standard FCC Part 15 Subpart C

#### The test was performed according to: ANSI C63.10

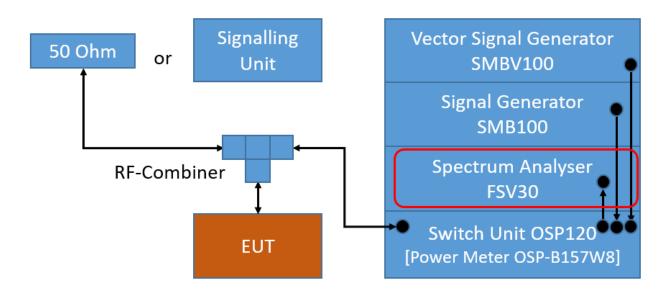

### 5.5.1 TEST DESCRIPTION

For the conducted measurement, the Equipment Under Test (EUT) is placed in a shielded room. The reference power was measured in the test case "Spurious RF Conducted Emissions".

The EUT was connected to the test system as described in the block diagram below. The complete attenuation of the measurement path is known and considered.

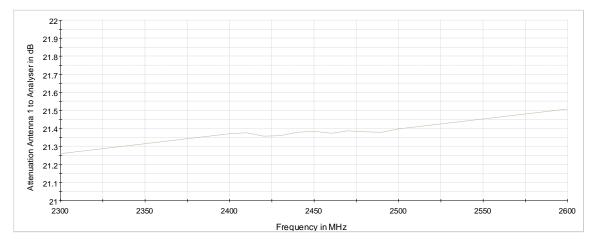

Analyser settings:

- Lower Band Edge: Measured range: 2310.0 MHz to 2483.5 MHz Upper Band Edge Measured range: 2400.0 MHz to 2500 MHz
- Detector: Peak
- Resolution Bandwidth (RBW): 100 kHz
- Video Bandwidth (VBW): 300 kHz
- Sweeptime: Auto
- Sweeps: Till stable (min. 300, max. 15000)
- Trace: Maxhold

TS8997; Band Edge Conducted

Attenuation of the measurement path

## 5.5.2 TEST REQUIREMENTS / LIMITS

### FCC Part 15.247 (d)

"In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. ...

If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c))."

For the conducted measurement the RF power at the band edge shall be "at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power..."

Remark: Please see next sub-clause for the measurement plot.

# 5.5.4 MEASUREMENT PLOT (EXAMPLE PLOT, SHOWING WORST CASE, IF APPLICABLE)

BT LE 4.2 GFSK Ch 39

5.5.5 TEST EQUIPMENT USED - R&S TS8997

## 5.6 BAND EDGE COMPLIANCE RADIATED

#### Standard FCC Part 15 Subpart C

#### The test was performed according to: ANSI C63.10

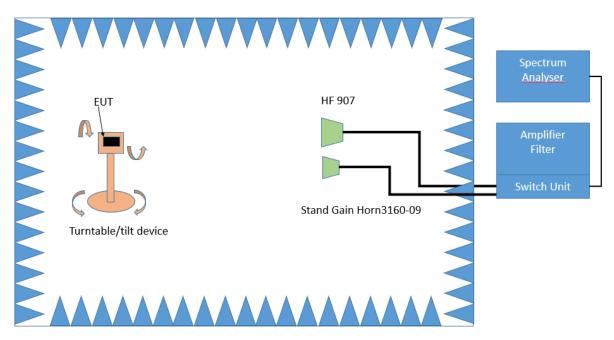

### 5.6.1 TEST DESCRIPTION

The test set-up was made in accordance to the general provisions of ANSI C63.10 in a typical installation configuration. The measurements were performed according the following sub-chapter of ANSI C63.10:

• Chapter 6.10.5

The Equipment Under Test (EUT) was set up on a non-conductive support (tilt device) at 1.5 m height in the fully-anechoic chamber.

All steps were performed with one height (1.5 m) of the receiving antenna only (procedure according ANSI C63.10, chapter 6.6.5.

#### 3. Measurement above 1 GHz

Test Setup; Spurious Emission Radiated (FAC), 1 GHz-26.5 GHz

#### Step 1:

The EUT is turned during the preliminary measurement across the elevation axis, with a step size of 90 °.

The turn table step size (azimuth angle) for the preliminary measurement is 45 °. Spectrum analyser settings:

- Detector: Peak, Average
- RBW = 1 MHz
- VBW = 3 MHz

#### Step 2:

TEST REPORT REFERENCE: MDE\_SKF\_2103\_FCC\_01\_rev01

The turn table azimuth will slowly vary by  $\pm$  22.5°. The elevation angle will slowly vary by  $\pm$  45° Spectrum analyser settings: - Detector: Peak

#### Step 3:

Spectrum analyser settings for step 3:

- Detector: Peak / CISPR Average
- Measured frequencies: in step 1 determined frequencies
- RBW = 1 MHz
- VBW = 3 MHz
- Measuring time: 1 s

## 5.6.2 TEST REQUIREMENTS / LIMITS

For band edges connected to a restricted band, the limits are specified in Section 15.209(a)

FCC Part 15, Subpart C, §15.209, Radiated Emission Limits

| Frequency in MHz | Limit (µV/m)     | Measurement<br>distance (m) | Limits (dBµV/m)    |
|------------------|------------------|-----------------------------|--------------------|
| 0.009 - 0.49     | 2400/F(kHz)@300m | 3                           | (48.5 – 13.8)@300m |
| 0.49 - 1.705     | 24000/F(kHz)@30m | 3                           | (33.8 – 23.0)@30m  |
| 1.705 - 30       | 30@30m           | 3                           | 29.5@30m           |

The measured values are corrected with an inverse linear distance extrapolation factor (40 dB/decade) according FCC 15.31 (2).

| Frequency in MHz | Limit (µV/m) | Measurement<br>distance (m) | Limits (dBµV/m) |
|------------------|--------------|-----------------------------|-----------------|
| 30 - 88          | 100@3m       | 3                           | 40.0@3m         |
| 88 - 216         | 150@3m       | 3                           | 43.5@3m         |
| 216 - 960        | 200@3m       | 3                           | 46.0@3m         |
| 960 - 26000      | 500@3m       | 3                           | 54.0@3m         |
| 26000 - 40000    | 500@3m       | 1                           | 54.0@3m         |

The measured values above 26 GHz are corrected with an inverse linear distance extrapolation factor (20 dB/decade).

§15.35(b) ..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit....

Used conversion factor: Limit  $(dB\mu V/m) = 20 \log (Limit (\mu V/m)/1\mu V/m)$

## 5.6.5 TEST EQUIPMENT USED

- Radiated Emissions FAR 2.4 GHz FCC

#### 5.7 POWER DENSITY

#### Standard FCC Part 15 Subpart C

#### The test was performed according to:

ANSI C63.10 Section 11.10.2

## 5.7.1 TEST DESCRIPTION

The Equipment Under Test (EUT) was set up in a shielded room to perform the Power Density measurements.

The results recorded were measured with the modulation which produces the worst-case (highest) power density.

The EUT was connected to the test system as described in the block diagram below. The complete attenuation of the measurement path is known and considered.

Maximum Peak Power Spectral Density (e.g. Bluetooth low energy):

Analyser settings:

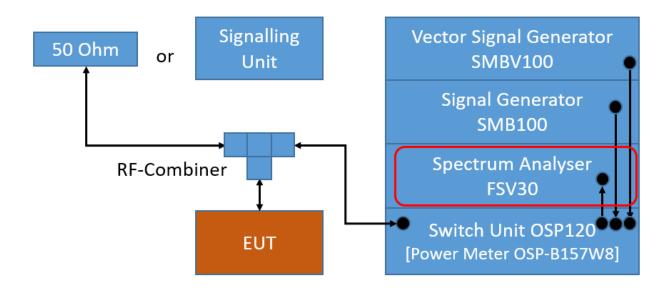

- Resolution Bandwidth (RBW): 100 kHz, 10 kHz or 3 kHz
- Video Bandwidth (VBW): ≥ 3 times RBW
- Trace: Maxhold
- Sweeps: Till stable (min. 200, max. 15000)
- Sweeptime: Auto
- Detector: Peak

Maximum Average Power Spectral Density (e.g. WLAN):

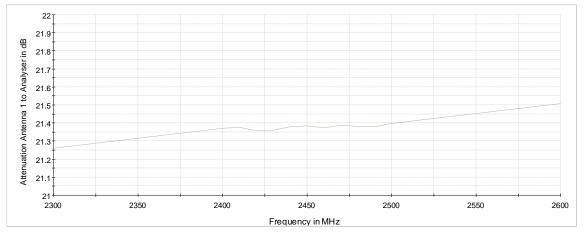

Analyser settings:

- Resolution Bandwidth (RBW): 100 kHz, 10 kHz or 3 kHz
- Video Bandwidth (VBW): ≥ 3 times RBW
- Sweep Points: ≥ 2 times span / RBW
- Trace: Maxhold
- Sweeps: Till stable (max. 150)
- Sweeptime:  $\leq$  Number of Sweep Points x minimum transmission duration
- Detector: RMS

TS8997; Power Spectral Density

Attenuation of the measurement path

## 5.7.2 TEST REQUIREMENTS / LIMITS

FCC Part 15, Subpart C, §15.247 (e)

For digitally modulated systems, the peak power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

....

The same method of determining the conducted output power shall be used to determine the power spectral density.

FCC Part 15, Subpart C, §15.247 (f)

(f) For the purposes of this section, hybrid systems are those that employ a combination of both frequency hopping and digital modulation techniques.

The power spectral density conducted from the intentional radiator to the antenna due to the digital modulation operation of the hybrid system, with the frequency hopping operation turned off, shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission

The calibration interval is the time interval between "Last Calibration" and "Calibration Due"

## 7 ANTENNA FACTORS, CABLE LOSS AND SAMPLE CALCULATIONS

This chapter contains the antenna factors with their corresponding path loss of the used measurement path for all antennas as well as the insertion loss of the LISN.

|           |       |           | cable     |

## 7.1 LISN R&S ESH3-Z5 (150 KHZ - 30 MHZ)

#### Sample calculation

 $U_{\text{LISN}}$  (dB  $\mu$ V) = U (dB  $\mu$ V) + Corr. (dB)

U = Receiver reading

LISN Insertion loss = Voltage Division Factor of LISN

Corr. = sum of single correction factors of used LISN, cables, switch units (if used)

Linear interpolation will be used for frequencies in between the values in the table.

## 7.2 ANTENNA R&S HFH2-Z2 (9 KHZ – 30 MHZ)

#### Sample calculation

 $E (dB \mu V/m) = U (dB \mu V) + AF (dB 1/m) + Corr. (dB)$ 

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable) distance correction =  $-40 * LOG (d_{Limit} / d_{used})$ 

Linear interpolation will be used for frequencies in between the values in the table.

Table shows an extract of values

## 7.3 ANTENNA R&S HL562 (30 MHZ – 1 GHZ)

#### Sample calculation

E (dB  $\mu$ V/m) = U (dB  $\mu$ V) + AF (dB 1/m) + Corr. (dB)

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable) distance correction =  $-20 * LOG (d_{Limit}/d_{used})$ 

Linear interpolation will be used for frequencies in between the values in the table.

Tables show an extract of values.

## 7.6 ANTENNA EMCO 3160-10 (26.5 GHZ - 40 GHZ)

#### Sample calculation

 $E (dB \mu V/m) = U (dB \mu V) + AF (dB 1/m) + Corr. (dB)$ 

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable) Linear interpolation will be used for frequencies in between the values in the table.

distance correction = -20 \* LOG ( $d_{\text{Limit}}/d_{\text{used}}$ ) Linear interpolation will be used for frequencies in between the values in the table.

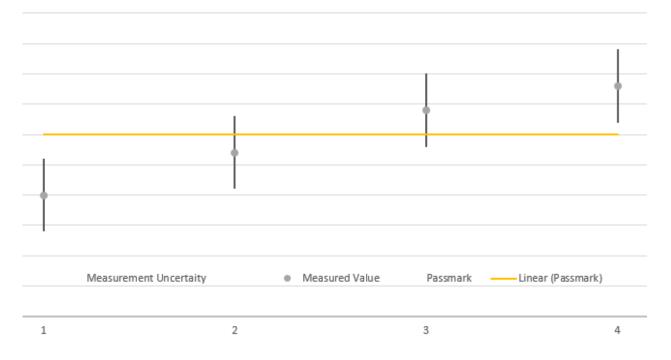

Table shows an extract of values.

## 8 MEASUREMENT UNCERTAINTIES

| Test Case                            | Parameter          | Uncertainty            |
|--------------------------------------|--------------------|------------------------|
| AC Power Line                        | Power              | ± 3.4 dB               |
| Field Strength of spurious radiation | Power              | ± 5.5 dB               |
| 6 dB / 26 dB / 99% Bandwidth         | Power<br>Frequency | ± 2.9 dB<br>± 11.2 kHz |
| Conducted Output Power               | Power              | ± 2.2 dB               |
| Band Edge Compliance                 | Power<br>Frequency | ± 2.2 dB<br>± 11.2 kHz |
| Frequency Stability                  | Frequency          | ± 25 Hz                |
| Power Spectral Density               | Power              | ± 2.2 dB               |

The measurement uncertainties for all parameters are calculated with an expansion factor (coverage factor) k = 1.96. This means, that the true value is in the corresponding interval with a probability of 95 %.

The verdicts in this test report are given according the above diagram:

| Case | Measured Value  | Uncertainty Range | Verdict |
|------|-----------------|-------------------|---------|
| 1    | below pass mark | below pass mark   | Passed  |
| 2    | below pass mark | within pass mark  | Passed  |
| 3    | above pass mark | within pass mark  | Failed  |
| 4    | above pass mark | above pass mark   | Failed  |

That means, the laboratory applies, as decision rule (see ISO/IEC 17025:2017), the so called shared risk principle.
