

RF Exposure evaluation

According to 447498 D01 General RF Exposure
Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for
100 MHz to 6 GHz at test separation distances \leq
50 mm are determined by:

[(max. power of channel, including tune-up
tolerance, mW) / (min. test separation distance,
mm)] \cdot [$\sqrt{f(\text{GHz})}$] \leq 3.0 for 1-g SAR and \leq 7.5 for
10-g extremity SAR, where

- $f(\text{GHz})$ is the RF channel transmit frequency in
GHz
- Power and distance are rounded to the nearest
mW and mm before calculation
- The result is rounded to one decimal place for
comparison

Worse case is as below: [2.441GHz 2.3dBm (1.7mW)
output power]

(1.7mW / 5mm) \cdot [$\sqrt{2.441(\text{GHz})}$] = 0.534 < 3.0 for 1-g
SAR

Then SAR evaluation is not required
