Applicant Name: Aduro Products LLC

Address: 250 Liberty Street, Metuchen, N.J, 08840, United States

Report Number: RA221121-55592E-RF FCC ID: 2AJUM-AC-STS-L

**Test Standard (s)** FCC PART 15.247

**Sample Description** 

**EMC** Engineer

Product Type: TWS Earbuds

Model No.: AC-STS-03, AC-STS-01, AC-STS-06, AC-STS-14

Trade Mark: Aconic

Date Received: 2022-11-21

Date of Test: 2022-12-07 to 2022-12-08

Report Date: 2022-12-09

Test Result: Pass\*

Prepared and Checked By:

Roger.Ling

# **DOCUMENT REVISION HISTORY**

Revision Number	Report Number	Description of Revision	Date of Revision
0	RA221121-55592E-RF	Original Report	2022-12-09

## **GENERAL INFORMATION**

# **Product Description for Equipment under Test (EUT)**

Product	TWS Earbuds
Tested Model	AC-STS-03
Multiple Model	AC-STS-01, AC-STS-06, AC-STS-14
Model difference*	Please refer to DOS letter
Frequency Range	2402~2480MHz
Maximum conducted Peak output power	0.1dBm
Modulation Technique	BDR(GFSK)/EDR(\pi/4-DQPSK)/EDR(8DPSK)
Antenna Specification*	Internal Antenna: 2.48dBi(provided by the applicant)
Voltage Range	DC 3.7V from battery
Sample number	RA221121-55592E-RF-S1 (RF Radiated Test) RA221121-55592E-RF-S2 (RF Conducted Test) (Assigned by ATC, Shenzhen)
Sample/EUT Status	Good condition

## **Objective**

This test report is in accordance with Part 2-Subpart J, Part 15-Subparts A and C of the Federal Communication Commission rules.

The tests were performed in order to determine compliance with FCC Part 15, Subpart C, section 15.203, 15.205, 15.209 and 15.247 rules.

### **Test Methodology**

All measurements contained in this report were conducted with ANSI C63.10-2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices.

All emissions measurement was performed at Shenzhen Accurate Technology Co., Ltd. The radiated testing was performed at an antenna-to-EUT distance of 3 meters.

#### **Measurement Uncertainty**

Parameter		Uncertainty	
Occupied Cha	nnel Bandwidth	5%	
RF Fr	equency	$0.082*10^{-7}$	
RF output po	wer, conducted	0.73dB	
Unwanted Emi	ssion, conducted	1.6dB	
- · ·	30MHz - 1GHz	4.28dB	
Emissions, Radiated	1GHz - 18GHz	4.98dB	
Radiated	18GHz - 26.5GHz	5.06dB	
Temperature		1℃	
Humidity		6%	
Supply	voltages	0.4%	

Note: The extended uncertainty given in this report is obtained by combining the standard uncertainty times the coverage factor K with the 95% confidence interval. Otherwise required by the applicant or Product Regulations, Decision Rule in this report did not consider the uncertainty.

#### **Test Facility**

The test site used by Shenzhen Accurate Technology Co., Ltd. to collect test data is located on the 1/F., Building A, Changyuan New Material Port, Science & Industry Park, Nanshan District, Shenzhen, Guangdong, P.R. China.

The test site has been approved by the FCC under the KDB 974614 D01 and is listed in the FCC Public Access Link (PAL) database, FCC Registration No.: 708358, the FCC Designation No.: CN1189.

Accredited by American Association for Laboratory Accreditation (A2LA). The Certificate Number is 4297.01

The lab has been recognized by Innovation, Science and Economic Development Canada to test to Canadian radio equipment requirements, the CAB identifier: CN0016. The Registration Number is 5077A.

# **SYSTEM TEST CONFIGURATION**

# **Description of Test Configuration**

The system was configured for testing in an engineering mode.

#### **EUT Exercise Software**

Software "BT toll"\* was used during testing and the power level was 6\*.

#### \_\_\_\_

# Report No.: RA221121-55592E-RF

# FCC§15.247 (i), §1.1307 (b) – RF EXPOSURE

## **Applicable Standard**

According to FCC §2.1093 and §1.1307(b), systems operating under the provisions of this section shall be operated in a manner that ensure that the public is not exposed to radio frequency energy level in excess of the Commission's guideline.

According to KDB 447498 D04 Interim General RF Exposure Guidance v01, clause 2.1.3.1-SAR-Based Exemption:

A more comprehensive exemption, considering a variable power threshold that depends on both the separation distance and power, is provided in § 1.1307(b)(3)(i)(B). This exemption is applicable to the frequency range between 300 MHz and 6 GHz, with test separation distances between 0.5 cm and 40 cm, and for all RF sources in fixed, mobile, and portable device exposure conditions.

Accordingly, a RF source is considered an RF exempt device if its available maximum time-averaged (matched conducted) power or its effective radiated power (ERP), whichever is greater, are below a specified threshold. This exemption threshold was derived based on general population 1-g SAR requirements and is detailed in Appendix C.

#### **Test Result**

#### For worst case:

Mode	Frequency	Maximum Tune-up Conducted Power	Antenna Gain		ERP	Distance	Excl	Based usion shold	SAR-Based Exclusion
	(MHz)	(dBm)	(dBi)	(dBd)	(dBm)	(mm)	(mW)	(dBm)	
BDR/EDR	2402-2480	0.5	2.48	0.33	0.83	5	2.717	4.34	Yes

Note 1: The tune-up power was declared by the applicant.

Note 2: 0dBd=2.15dBi.

Result: Compliant.

# Report No.: RA221121-55592E-RF

# FCC §15.203 – ANTENNA REQUIREMENT

## **Applicable Standard**

According to FCC § 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

#### **Antenna Connector Construction**

The EUT has one internal antenna arrangement, which was permanently attached and the antenna gain is 2.48dBi, fulfill the requirement of this section. Please refer to the EUT photos.

**Result:** Compliant.

# FCC §15.205, §15.209 & §15.247(d) – RADIATED EMISSIONS

### **Applicable Standard**

FCC §15.205; §15.209; §15.247(d)

#### **EUT Setup**

#### **Below 1 GHz:**

#### **Above 1GHz:**

The radiated emission performed in the 3 meters, using the setup accordance with the ANSI C63.10-2013. The specification used was the FCC 15.209, FCC 15.247 limits.

#### **EMI Test Receiver & Spectrum Analyzer Setup**

The EMI test receiver & Spectrum Analyzer Setup were set with the following configurations:

Frequency Range	RBW	Video B/W	IF B/W	Measurement
30 MHz – 1000 MHz	100 kHz	300 kHz	120 kHz	QP
Above 1 GHz	1 MHz	3 MHz	/	PK

For average measurement:

Use the duty cycle factor correction factor method per 15.35(c). Duty cycle=On time/100milliseconds, On time=N1\*L1+N2\*L2+...Nn-1\*Ln-1+Nn\*Ln, Where N1 is number of type 1 pulses, L1 is length of type 1 pulse, etc. Average Emission Level=Peak Emission Level+20\*log(Duty cycle)

#### **Test Procedure**

Maximizing procedure was performed on the highest emissions to ensure that the EUT complied with all installation combinations.

All final data was recorded in Quasi-peak detection mode for frequency range of 30 MHz -1 GHz and peak and Average detection modes for frequencies above 1 GHz.

If the maximized peak measured value complies with the limit, then it is unnecessary to perform an QP/Average measurement

#### **Factor & Margin Calculation**

The Factor is calculated by adding the Antenna Factor and Cable Loss, and subtracting the Amplifier Gain. The basic equation is as follows:

Factor = Antenna Factor + Cable Loss - Amplifier Gain

The "Over Limit/Margin" column of the following data tables indicates the degree of compliance with the applicable limit. For example, an Over Limit/margin of -7dB means the emission is 7dB below the limit. The equation for calculation is as follows:

Over Limit/Margin = Level / Corrected Amplitude – Limit Level / Corrected Amplitude = Read Level + Factor

### **Test Data**

#### **Environmental Conditions**

Temperature:	24°C
Relative Humidity:	56%
ATM Pressure:	101kPa

The testing was performed by Jason Liu on 2022-12-08.

EUT operation mode: Transmitting

(Scan with GFSK,  $\pi/4$ -DQPSK, 8DPSK mode at X axis, Y axis, Z axis, the worst case is 8DPSK Mode at Y axis)

### Below 1GHz: 8DPSK, Low Channel

#### Horizontal

Site : chamber

Condition: 3m HORIZONTAL Job No. : RA221121-55592E-RF

Test Mode: BT transmitting

Note: the emissions were 20dB below limit or in noise floor level

#### Vertical

Site : chamber Condition: 3m VERTICAL

Job No. : RA221121-55592E-RF Test Mode: BT transmitting

Note: the emissions were 20dB below limit or in noise floor level

### Above 1GHz (worst case for 8DPSK):

Frequency (MHz)	Receiver		Turntable	Rx Antenna		Factor	Absolute	Limit	Margin
	Reading (dBuV)	PK/Ave	Angle Degree	Height (m)	Polar (H/V)	(dB/m)	Level (dBuV/m)	(dBuV/m)	(dB)
Low Channel									
2310	46.35	PK	92	1.6	Н	-7.23	39.12	74	-34.88
2310	48.72	PK	106	1.3	V	-7.23	41.49	74	-32.51
2390	45.94	PK	102	1.4	Н	-7.21	38.73	74	-35.27
2390	49.16	PK	242	1.7	V	-7.21	41.95	74	-32.05
4804	49.47	PK	141	1.0	Н	-3.52	45.95	74	-28.05

				Middle C	hannel				
4882	48.91	PK	102	1.3	Н	-3.37	45.54	74	-28.46
4882	47.81	PK	24	1.1	V	-3.37	44.44	74	-29.56
	High Channel								
2483.5	47.03	PK	196	1.4	Н	-7.2	39.83	74	-34.17
2483.5	47.2	PK	191	1.1	V	-7.2	40	74	-34.00
2500	47.55	PK	104	1.0	Н	-7.18	40.37	74	-33.63
2500	46.99	PK	62	1.9	V	-7.18	39.81	74	-34.19
4960	48.59	PK	261	1.3	Н	-3.01	45.58	74	-28.42
4960	48.04	PK	308	2.0	V	-3.01	45.03	74	-28.97

#### Note:

 $Factor = Antenna \; factor \; (RX) + Cable \; Loss - Amplifier \; Factor \;$ 

Absolute Level (Corrected Amplitude) = Factor + Reading

Margin = Absolute Level (Corrected Amplitude) – Limit

The other spurious emission which is in the noise floor level was not recorded.

For above 1GHz, the test result of peak was 20dB below to the limit of peak, which can be compliant to the average limit, so just peak value was recorded.

# FCC §15.247(a) (1)-CHANNEL SEPARATION TEST

#### **Applicable Standard**

Frequency hopping systems shall have hoping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

#### **Test Procedure**

- 1. Set the EUT in TX mode, maxhold the channel.
- 2. Set the adjacent channel of the EUT and maxhold another trace.
- 3. Measure the channel separation.

#### **Test Data**

#### **Environmental Conditions**

Temperature:	24℃	
Relative Humidity:	48%	
ATM Pressure:	101kPa	

The testing was performed by Glenn. Jiang on 2022-12-07.

EUT operation mode: Transmitting

Test Result: Compliant.

Test Mode	Antenna	Channel	Result[MHz]	Limit[MHz]	Verdict

2DH5	Ant1	Нор	1	>=0.854	PASS
3DH5	Ant1	Нор	1	>=0.860	PASS

Note: The limit = (2/3) \* 20dB bandwidth

Please refer to the below plots:

Date: 7.DEC.2022 14:36:18

Date: 7.DEC.2022 14:50:05

# FCC §15.247(a) (1) – 20 dB EMISSION BANDWIDTH & 99% OCCUPIED BANDWIDTH

## **Applicable Standard**

Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

#### **Test Procedure**

The following conditions shall be observed for measuring the occupied bandwidth and 20 dB bandwidth:

- The transmitter shall be operated at its maximum carrier power measured under normal test conditions.
- The span of the spectrum analyzer shall be set large enough to capture all products of the modulation process, including the emission skirts, around the carrier frequency, but small enough to avoid having other emissions (e.g. on adjacent channels) within the span.
- The detector of the spectrum analyzer shall be set to "Sample". However, a peak, or peak hold, may be used in place of the sampling detector since this usually produces a wider bandwidth than the actual bandwidth (worst-case measurement). Use of a peak hold (or "Max Hold") may be necessary to determine the occupied / 20 dB bandwidth if the device is not TX continuously.
- The resolution bandwidth (RBW) shall be in the range of 1% to 5% of the actual occupied / 20 dB bandwidth and the video bandwidth (VBW) shall not be smaller than three times the RBW value. Video averaging is not permitted.

Note: It may be necessary to repeat the measurement a few times until the RBW and VBW are in compliance with the above requirement.

For the 99% emission bandwidth, the trace data points are recovered and directly summed in linear power level terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached, and that frequency recorded. The process is repeated for the highest frequency data points (starting at the highest frequency, at the right side of the span, and going down in frequency). This frequency is then recorded. The difference between the two recorded frequencies is the occupied bandwidth (or the 99% emission bandwidth).

### **Test Data**

### **Environmental Conditions**

# FCC §15.247(a) (1) (iii)-QUANTITY OF HOPPING CHANNEL TEST

## **Applicable Standard**

Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

#### **Test Procedure**

- 1. Check the calibration of the measuring instrument (SA) using either an internal calibrator or a known signal from an external generator.
- 2. Set the EUT in hopping mode from first channel to last.
- 3. By using the max-hold function record the quantity of the channel.

#### **Test Data**

#### **Environmental Conditions**

Temperature:	24℃	
Relative Humidity:	48%	
ATM Pressure:	101kPa	

The testing was performed by Glenn. Jiang on 2022-12-07.

EUT operation mode: Transmitting

Test Result: Compliant.

Test Mode	Antenna	Channel	Result[Num]	Limit[Num]	Verdict

# FCC §15.247(a) (1) (iii) - TIME OF OCCUPANCY (DWELL TIME)

# **Applicable Standard**

Frequency hopping systems in the 2400-2483.5 MHz shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

### **Test Procedure**

- 1. The EUT was worked in channel hopping.
- 2. Set the RBW to: 1MHz.
- 3. Set the VBW  $\geq$  3×RBW.
- 4. Set the span to 0Hz.
- 5. Detector = peak.
- 6. Sweep time = auto couple.
- 7. Trace mode = max hold.
- 8. Allow trace to fully stabilize.
- 9. Recorded the time of single pulses

# FCC §15.247(b) (1) - PEAK OUTPUT POWER MEASUREMENT

# **Applicable Standard**

According to §15.247(b) (1), for frequency hopping systems operating in the 2400–2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. And for all other frequency hopping systems in the 2400–2483.5 MHz band: 0.125 watts.

#### **Test Procedure**

- 1. Place the EUT on a bench and set in TX mode.
- 2. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to one test equipment.
- 3. Add a correction factor to the display.

### **Test Data**

### **Environmental Conditions**

Temperature:	24°C
Relative Humidity:	48%
ATM Pressure:	101kPa

The testing was performed by Glenn. Jiang on 2022-12-07.

# FCC §15.247(d) - BAND EDGES TESTING

## **Applicable Standard**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

#### **Test Procedure**

- 1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- 2. Remove the antenna from the EUT and then connect to a low loss RF cable from the antenna port to a EMI test receiver, then turn on the EUT and make it operate in TX mode. Then set it to Low Channel and High Channel within its operating range, and make sure the instrument is operated in its linear range.
- 3. Set RBW of spectrum analyzer to 100 kHz with a convenient frequency span including 100 kHz bandwidth from band edge.
- 4. Measure the highest amplitude appearing on spectral display and set it as a reference level. Plot the graph with marking the highest point and edge frequency.
- 5. Repeat above procedures until all measured frequencies were complete.
