

Electromagnetic Compatibility Test Report

Tests Performed on a Latchable, Inc.

Entry Security System, Model L2

Radiometrics Document RP-9335

Product Detail:

FCC ID: 2AK5B-L2

IC: 22134-L2

Equipment type: Low power transmitter

Test Standards:

US CFR Title 47, Chapter I, FCC Part 15 Subpart C

FCC Part 15 CFR Title 47: 2020

Canada ISSED; RSS-210, Issue 10: 2019 as required for Category I Equipment

Canada ISSED; RSS-247, Issue 2

IC RSS-GEN Issue 5: 2018

This report concerns: Original Grant for Certification

FCC Part 15.247, 15.209 & 15.249

Tests Performed For:

Latchable, Inc.

508 W. 26th Street, Suite 6G

New York, NY 10001

Test Facility:

Radiometrics Midwest Corporation

12 Devonwood Avenue

Romeoville, IL 60446-1349

(815) 293-0772

Test Date(s):

August 14 thru 25, 2020

2.0 TEST SUMMARY AND RESULTS

The EUT (Equipment Under Test) is an Entry Security System, Model L2, manufactured by Latchable, Inc. The detailed test results are presented in a separate section. The following is a summary of the test results.

Bluetooth Results

Environmental Phenomena	Frequency Range	RSS Spec	RSS section	FCC Section	Test Result
All RF Radiated Emissions Fundamental and Spurious	30-25,000 MHz	RSS-210	B.10	15.249	Pass
Conducted Emissions, AC Mains	0.15 - 30 MHz	RSS-Gen	8.8	15.249	Pass
Occupied Bandwidth Test	Fundamental Freq.	RSS-Gen	6.6	15.249	Pass

**Unintentional Emissions Tests Results**

Environmental Phenomena	Frequency Range	Basic Standard	Test Result
RF Radiated Emissions	30-12,500 MHz	RSS-Gen & FCC Part 15	Pass
Conducted Emissions, AC Mains	0.15 - 30 MHz	RSS-Gen & FCC Part 15	Pass

13.56 MHz RFID results

Environmental Phenomena	Frequency Range	Test Result
RF Radiated Emissions	30-1000 MHz	Pass
RF Radiated Emissions H-Field	0.009 – 30 MHz	Pass
Occupied Bandwidth	13.56 MHz	Pass

The 13.56 MHz met the general limits of 15.209, so temperature stability tests were not performed. The Bluetooth transmitters met the FCC 15.249 results.

IEC 17025 Decision Rule:

The declaration of pass or fail is based on the specifications listed above. The declaration of pass or fail did not consider measurement uncertainty.

3.0 EQUIPMENT UNDER TEST (EUT) DETAILS**3.1 EUT Description**

The EUT is an Entry Security System, Model L2, manufactured by Latchable, Inc. The EUT was in good working condition during the tests, with no known defects.

3.1.1 FCC Section 15.203 & RSS-GEN Antenna Requirements

The Bluetooth antenna is permanently attached to the printed circuit board. The 13.56 MHz RFID antenna is connected by a unique ribbon cable, is internal to the EUT and it is not readily available to be modified by the end user. Therefore, it meets the 15.203 Requirements.

Since the measurements at the antenna port are used to determine the RF output power, RSS-GEN section 6.8 requires that the effective gain of the product's antenna be stated, based on a measurement or on data from the antenna's manufacturer. The gain of the Bluetooth and the RFID are 0 dBi.

4.0 TESTED SYSTEM DETAILS**4.1 Tested System Configuration**

The system was configured for testing in a typical fashion. The EUT was placed on an 80-cm or 150 cm high, nonconductive test stand. The testing was performed in conditions as close as possible to installed conditions. Wiring was consistent with manufacturer's recommendations. Since the EUT is wall or door mounted, it was placed in an upright configuration during the tests. The EUT was tested as a stand-alone device. Power was supplied at 120 VAC, 60 Hz single-phase to its external power supply.

The identification for all equipment, plus descriptions of all cables used in the tested system, are:

**Tested System Configuration List**

Item	Description	Type*	Manufacturer	Model Number	Serial Number
1	Entry Security System	E	Latchable, Inc.	L2	None
2	AC-DC Power Supply	S	Triad	WSU090-1300	1749

* Type: E = EUT, P = Peripheral, S = Support Equipment; H = Host Computer

List of System Cables

QTY	Length (m)	Cable Description	Shielded?
1	1.8	DC Cord from power supply to EUT (L2)	No
1	1.3	Ethernet cable to router	No
1	1.0	12 conductor I/O cable	No

4.2 EUT Operating Modes**Bluetooth testing:**

The EUT was transmitting continuously with its maximum duty cycle.

13.56 MHz testing:

The EUT was transmitting continuously with its maximum duty cycle.

4.3 Special Accessories

No special accessories were used during the tests in order to achieve compliance.

4.4 Equipment Modifications

No modifications were made to the EUT at Radiometrics' test facility in order to comply with the standards listed in this report.

5.0 TEST SPECIFICATIONS

Document	Date	Title
FCC CFR Title 47	2020	Code of Federal Regulations Title 47, Chapter 1, Federal Communications Commission, Part 15 - Radio Frequency Devices
IC RSS-210 Issue 10	2019	Low Power Licence-Exempt Radiocommunication Devices (All Frequency Bands) Category I Equipment
IC RSS-247 Issue 2	2017	Digital Transmission Systems (DTSS), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices
IC RSS-Gen Issue 5	2019	General Requirements and Information for the Certification of Radiocommunication Equipment (RSS-Gen)

6.0 TEST PROCEDURE DOCUMENTS

The tests were performed using the procedures from the following specifications:

Document	Date	Title
ANSI C63.4-2014	2014	Methods of Measurement of Radio Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz
ANSI C63.10-2013	2013	American National Standard for Testing Unlicensed Wireless Devices
558074 D01 DTS Meas Guidance	2019	Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247; v05r02

7.0 RADIOMETRICS' TEST FACILITIES

The results of these tests were obtained at Radiometrics Midwest Corp. in Romeoville, Illinois, USA. Radiometrics is accredited by A2LA (American Association for Laboratory Accreditation) to conform to ISO/IEC 17025: 2005 "General Requirements for the Competence of Calibration and Testing Laboratories". Radiometrics' Lab Code is 121191 and Certification Number is 1495.01. Radiometrics' scope of accreditation includes all of the test methods listed herein. A copy of the accreditation can be accessed on our web site (www.radiomet.com). Radiometrics accreditation status can be verified at A2LA's web site (www.a2la2.org).

The following is a list of shielded enclosures located in Romeoville, Illinois used during the tests:

Chamber E: Is a custom-made anechoic chamber that measures 52' L X 30' W X 18' H. The walls and ceiling are fully lined with RF absorber. Pro-shield of Collinsville, Oklahoma manufactured the chamber. The floor has a 9' x 9' section of microwave absorber for testing above 1 GHz.

Test Station F: Is an area that measures 10' D X 12' W X 10' H. The floor and back wall are metal shielded. This area is used for conducted emissions measurements.

A separate ten-foot long, brass plated, steel ground rod attached via a 6-inch copper braid grounds each of the above chambers. Each enclosure is also equipped with low-pass power line filters.

The FCC has accepted these sites as test site number US1065. The FCC test site Registration Number is 732175. Details of the site characteristics are on file with the Industry Canada as site number IC 3124A-1.

A complete list of the test equipment is provided herein. The calibration due dates are indicated on the equipment list. The equipment is calibrated in accordance with ANSI/NCSL Z540-1 with traceability to the National Institute of Standards and Technology (NIST).

8.0 DEVIATIONS AND EXCLUSIONS FROM THE TEST SPECIFICATIONS

There were no deviations or exclusions from the test specifications.

9.0 CERTIFICATION

Radiometrics Midwest Corporation certifies that the data contained herein was taken under conditions that meet or exceed the requirements of the test specification and the data contained herein was taken with calibrated test equipment. The results relate only to the EUT listed herein.

**10.0 TEST EQUIPMENT TABLE**

Note: All calibrated equipment is subject to periodic checks.

The test equipment was in calibration during the tests.

Software Company	Test Software Name	Version	Applicable Tests
Radiometrics	EN550XX0	07.16.19	RF Conducted Emissions (FCC Part 15 & EN 55032)
Radiometrics	REREC11D	07.16.19	RF Radiated Emissions (FCC Part 15 & EN 55032)
Agilent	PSA/ESA-E/L/EMC	2.4.0.42	Bandwidth and screen shots

11.0 TEST SECTIONS**12.0 AC CONDUCTED EMISSIONS**

The tests and limits are in accordance with FCC section 15.207 and RSS Gen section 8.8.

A computer-controlled analyzer was used to perform the conducted emissions measurements. The frequency range was divided into 500 subranges equally spaced on a logarithmic scale. The computer recorded the peak of each subrange. This data was then plotted on a semi-log graph generated by the computer. Adjusting the positions of the cables and orientation of the test system then maximizes the highest emissions.

Mains Conducted emission measurements were performed using a 50 Ohm/50 uH Line Impedance Stabilization Network (LISN) as the pick-up device. Measurements were repeated on both leads within the power cord. If the EUT power cord exceeded 80 cm in length, the excess length of the power cord was made into a 30 to 40 cm bundle near the center of the cord. The LISN was placed on the floor at the base of the test platform and electrically bonded to the ground plane.

**FCC Limits of Conducted Emissions at the AC Mains Ports**

Frequency Range (MHz)	Class B Limits (dBuV)	
	Quasi-Peak	Average
0.150 - 0.50*	66 - 56	56 - 46
0.5 – 5.0	56	46
5.0 - 30	60	50
* The limit decreases linearly with the logarithm of the frequency in this range.		

The initial step in collecting conducted data is a peak detector scan and the plotting of the measurement range. Significant peaks are then marked as shown on the following table, and these signals are then measured with the quasi-peak detector. The following represents the worst case emissions from the EUT power supply, after testing all modes of operation.

The transmitter was tested with a dummy load under the following conditions:

- 1) First, perform the AC line conducted tests with the antenna attached were performed to determine if the EUT complies with the 15.207 limits outside the transmitter's fundamental emission band.
- 2) The AC line conducted emissions were retested with a dummy load of to make sure the device complies with the 15.207 limits inside the transmitter's fundamental emission band. Only the fundamental TX emission band needs to be retested. The load was 100 Ohm. This is the characteristic impedance of the antenna.

Test Date : August 14 & 21, 2020

The Amplitude is the final corrected value with cable and LISN Loss.

With Antenna installed

Frequency (MHz)	QP Amplitude (dBuV)	QP Limit (dBuV)	Average Amplitude (dBuV)	Average Limit (dBuV)	Margin (dB)
0.165	40.7	65.2	23.6	55.2	24.5
0.260	35.1	61.4	24.1	51.4	26.3
0.310	38.1	60.0	23.8	50.0	21.8
13.560	53.6	60.0	48.8	50.0	1.2

The emission at 13.56 MHz was re-measured with a resistive load in place of the antenna and was fully compliant.

Judgement: Pass by at least 10 dB.

With Antenna installed

Frequency (MHz)	QP Amplitude (dBuV)	QP Limit (dBuV)	Average Amplitude (dBuV)	Average Limit (dBuV)	Margin (dB)
0.167	-8.9	65.1	26.2	55.1	29.0
0.283	36.3	60.7	22.4	50.7	24.4
0.411	23.1	57.6	6.9	47.6	34.5
13.561	49.9	60.0	44.2	50.0	5.8

The emission at 13.56 MHz was re-measured with a resistive load in place of the antenna and was fully compliant.

Judgement: Pass by at least 10 dB.

With a 100-ohm load resistor substituted for the 13.56MHz Antenna

Frequency (MHz)	QP Amplitude (dBuV)	QP Limit (dBuV)	Average Amplitude (dBuV)	Average Limit (dBuV)	Margin (dB)
0.161	44.0	65.4	25.3	55.4	21.4
0.253	37.9	61.6	25.2	51.6	23.7

Pass by at least 20 dB at 13.56 MHz with Load in place of antenna

With a 100-ohm load resistor substituted for the 13.56MHz Antenna

Frequency (MHz)	QP Amplitude (dBuV)	QP Limit (dBuV)	Average Amplitude (dBuV)	Average Limit (dBuV)	Margin (dB)
0.160	43.9	65.5	22.9	55.5	21.6
0.333	36.4	59.4	20.2	49.4	23.0
0.506	22.5	56.0	10.2	46.0	33.5

Pass by at least 20 dB at 13.56 MHz with Load in place of antenna

Judgment: Passed by at least 10 dB

12.1 Radiated RF Emissions

The procedures were in accordance to ANSI C63.10. Radiated emission measurements were performed with linearly polarized broadband antennas. The results obtained with these antennas can be correlated with results obtained with a tuned dipole antenna. The radiated emission measurements were performed with a spectrum analyzer. The bandwidth used from 30 MHz to 1000 MHz is 120 kHz. Above 1 GHz, a 1 MHz bandwidth is used. A 10 dB linearity check is performed prior to start of testing in order to determine if an overload condition exists. Figure 4 herein lists the details of the test equipment used during radiated emissions tests.

The EUT was rotated through three orthogonal axis as per 5.10.1 of ANSI C63.10 during the radiated tests.

For tests from 1 to 10 GHz, a high pass filter was used to reduce the fundamental emission. High pass filters were not needed above 10 GHz, since the preamplifiers attenuated the fundamental emission. The test setup drawing herein lists the details of the test equipment used during radiated emissions tests.

Radiated emissions measurements were performed inside of an anechoic chamber at a test distance of 3 meters. The anechoic chamber is designated as Chamber E. This Chamber meets the Site Attenuation requirements of ANSI C63.4. Chamber E is located at 12 Devonwood Ave. Romeoville, Illinois EMI test lab.

The entire frequency range from 30 to 25,000 MHz was slowly scanned. Measurements were performed using two antenna polarizations, (vertical and horizontal). The worst-case emissions were recorded. All measurements may be performed using either the peak, average or quasi-peak detector functions. If the peak detector data exceeds or is marginally close to the limits, the measurements are repeated using a quasi-peak detector or average function as required by the specification for final determination of compliance.

The detected emission levels were maximized by rotating the EUT, adjusting the positions of all cables, and by scanning the measurement antenna from 1 to 4 meters above the ground.

Unintentional Radiated Emissions Field Strength Limits

Frequency Range (MHz)	Test Distance (meters)	Class B Limits	
		uV/m	dB(uV/m)
0.009-0.490	300	2400/F(kHz)	20*LOG(2400/kHz)
0.490-1.705	30	24000/F(kHz)	20*LOG(24000/kHz)
1.705-30.0	30	30	29.5
30 - 88	3	100	40.0
88 - 216	3	150	43.5
216 - 960	3	200	46.0
Above 960	3	500	54.0

FCC 15.249 & RSS-210 B.10 Radiated Emissions Limits

Frequency Range	Test Distance (meters)	Field strength of fundamental		Field strength of harmonics	
		mV/m	dB(uV/m)	uV/m	dB(uV/m)
902-928 MHz	3	50	94.0	500	54.0
2400-2483.5 MHz	3	50	94.0	500	54.0
5725-5875 MHz	3	50	94.0	500	54.0
24.0-24.25 GHz	3	250	108.0	2500	68.0

12.1.1 Radiated Emissions Field Strength Sample Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and by subtracting the Amplifier Gain from the measured reading. The antenna factor converts the voltage reading in dBuV to field strength in dBuV/meter. The basic equation is as follows:

$$FS = RA + AF + CF - AG$$

Where: FS = Field Strength in dBuV/m

RA = Receiver Amplitude dBuV

AF = Antenna Factor dB/m

CF = Cable Attenuation Factor dB

AG = Amplifier Gain dB

HPF = High pass Filter Loss dB

12.2 Radiated Emissions Results

Test Date	August 17 & 18, 2020
Test Distance	3 Meters
Specification	FCC Part 15 Subpart C & RSS-210 Section B.10
Abbreviations	Pol = Antenna Polarization; V = Vertical; H = Horizontal; P = peak; Q = QP
Configuration	Transmitting, Bluetooth and NFC 13.56 MHz, with the receiver on. With TRIAD Power supply WS2U090-1300

This table includes all emissions except Fundamental, Band edge and harmonics emissions.

Column #1. hrm = Harmonic; BE = Band Edge emissions

Column #2. Frequency of Transmitter.

Column #3. Uncorrected readings from the spectrum analyzer with First Axis Rotation.

Column #4. Uncorrected readings from the spectrum analyzer with Second Axis Rotation.

Column #5. Uncorrected readings from the spectrum analyzer with Third Axis Rotation.

Column #6. Average Reading based on peak reading reduced by the Duty cycle correction

Column #7. Uncorrected readings from the spectrum analyzer with First Axis Rotation.

Column #8. Uncorrected readings from the spectrum analyzer with Second Axis Rotation.

Column #9. Uncorrected readings from the spectrum analyzer with Third Axis Rotation.

Column #10. Average Reading based on peak reading reduced by the Duty cycle correction

Column #11. Corr. Factors = Cable Loss – Preamp Gain + Antenna Factor

Column #12. Frequency of Tested Emission

Column #13. Highest peak field strength at listed frequency.

Column #14. Highest Average field strength at listed frequency.

Column #15. Peak Limit.

Column #16. Average Limit.

Column #17. The margin (last column) is the worst-case margin under the peak or average limits for that row.

Judgment: Passed by 8.7 dB

All emissions outside of the band from 2340 to 2483.5 were below the limits of 15.209.

No other Emissions were detected from 30 to 25,000 MHz within 10 dB of the limits.

12.3 Occupied Bandwidth Data

The occupied bandwidth of the RF output was measured using a spectrum analyzer. The bandwidth was measured using the peak detector function. The spectrum analyzer was set to the MAX HOLD mode to record the worst case of the modulation. The marker-to-peak function was set to the peak of the emission. Then the marker-delta function was used to measure 20 dB down one side of the emission. The marker-delta function was reset and then moved to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the bandwidth of the emission. The plots of the occupied bandwidth for the EUT are supplied on the following pages.

The 20 dB OBW is within the allowed 2400 to 2483.5 MHz authorized band.

EUT	Channel	20 dB OBW MHz	99% EBW MHz
BT	2402	1.084	1.428
BT	2440	1.094	1.288

12.4 Band-edge Compliance of RF Conducted Emissions

The spectrum analyzer was set to the MAX HOLD mode to record the worst case of the modulation at the band-edge, with the EUT set to the lowest frequency. The trace was allowed to stabilize.

Tested by: Joseph Strzelecki/ Richard Tichgelaar

Test Date: August 18, 2020

Mode	Freq (MHz)	Band Edge Delta Readings in dB
Hopping	2400.0	45.76
Hopping	2483.5	50.85
Non-hopping	2400.0	45.57
Non-hopping	2483.5	50.53

This information is used to calculate band edge for emissions at 2400 MHz in accordance with ANSI C63.10 Section 6.10.6. The lowest number was used for the calculations.

The emission at 2483.5 MHz was measured the conventional way since the upper edge of the occupied bandwidth is more than 2xRBW from the band edge. The results are presented in Section 12.2 herein.

Hopping Mode:

Non-Hopping Mode:

12.5 Duty Cycle

The average value of the pulsed emissions were measured as per section 7.5, formula (10) of ANSI C63.10-2013.

a) The EUT was set to the “worst-case” pulse ON time.

- b) The RF output was coupled to the input of a spectrum analyzer by a “near-field” coupling method. The signal received shall be of sufficient level to trigger adequately the spectrum analyzer sweep display.
- c) The center frequency of the spectrum analyzer was set to the center of the RF signal.
- d) The spectrum analyzer was set for ZERO SPAN.
- e) The sweep time of the analyzer was set to 100 ms and other times to show the duty cycle.
- f) Since the pulse train has a period that exceeds 100 ms, or as an alternative to step f), then:
- 1) The trigger on the spectrum analyzer was set to capture the greatest amount of pulse “ON time” over 100 ms.
 - 2) The 100 ms period that contains the maximum “on time” was found.
 - 3) The duty cycle was determined by dividing the total maximum “ON time” by 100 ms (tON/100 ms).
- h) The duty cycle correction factor was used applying Equation (10) of ANSI C63.10 to the duty cycle determined in the preceding steps.

The Peak to average factor is calculated by the highest duty cycle in percent over any 100mS transmission. The factor in dB is $20 * \text{Log}(\text{Duty cycle}/100)$. The transmitter operates for a maximum duration of 9.93 ms in any 100 ms interval for a 0.2% maximum duty cycle. $20 \text{ Log}(9.3\text{mSec}/100\text{mSec}) = -20.63 \text{ dB}$ Peak to average Correction factor.

Since the difference between the peak and the average limits are 20 dB, there is no need to use a correction factor of more than 20 dB. Therefore, a 20 dB factor was used.

Tested by: Richard Tichgelaar

Test Date: August 25, 2020

Figure 1. Duty Cycle Plots

13.0 FCC 15.209 TESTS RESULTS

13.1 Magnetic Field Measurements and Decay Factor Calculations

Radiated emission measurements are performed with an EMCO shielded loop antenna. The antenna was rotated in order to find the maximize readings.

The distance correction factor is calculated as follows:

The distance factor in (dB) = $DE \cdot 20 \cdot \log(TD/SD)$

Where: DE = Decay Exponent (2.0 is used for this)

TD = Test distance in meters. This is 3 meters

SD = Specification Distance in meters

From 9 kHz to 490 kHz, the Specification Distance is 300m therefore the distance factor is $2 \cdot 20 \cdot \log(300/3) = 80$ dB. From 490 kHz to 30 MHz, the Specification Distance is 30m therefore the distance factor is $2 \cdot 20 \cdot \log(30/3) = 40$ dB.

Note1 : Peak reading below Average limits, so average readings not performed for that frequency.

Judgment: Passed by 7.0 dB

Tabulated data from above represented graphically.

14.1 Occupied Bandwidth Data

The occupied bandwidth of the RF output was measured using a spectrum analyzer using a peak detector function and a narrow resolution bandwidth. A broadband antenna was used to receive the modulated signal. The spectrum analyzer was set to the MAX HOLD mode to record the worst case of the modulation. The spectrum analyzer display was digitized and plotted. The plots of the occupied bandwidth for the EUT are supplied on the following page.

Model	L2	Specification	FCC Part 15.209 RSS-GEN
Test Personnel	Richard Tichgelaar	Test Date	08/18/2020

99% OBW = 240 Hz

Judgement: Pass

Figure 2. Occupied Bandwidth Plot

Worst case OBW

15.0 GENERAL TEST SETUPS

Figure 3. Conducted Emissions Test Setup

1x1.5m surface

Notes:

- LISN's at least 80 cm from EUT chassis
- Vertical conductive plane 40 cm from rear of tabletop
- EUT power cord bundled

Figure 4. Drawing of Radiated Emissions Setup

Chamber E, anechoic

Frequency Range	Receive Antenna	Pre-Amplifier	Spectrum Analyzer	High Pass Filter
0.01 to 30 MHz	ANT-53	None	REC-21	None
30 to 200 MHz	ANT-80	None	REC-21	None
200 to 1000 MHz	ANT-08	None	REC-21	None
1 to 10 GHz	ANT-66	AMP-05	REC-21	HPF-06
10 to 18 GHz	ANT-66	AMP-20	REC-21	None*
18 to 25 GHz	ANT-66	AMP-59	REC-21	None*

* A high pass filter was not needed since the fundamental frequency was outside of the amplifiers pass band.

**16.0 MEASUREMENT INSTRUMENTATION UNCERTAINTY**

Measurement	Uncertainty
Conducted Emissions, LISN method, 150 kHz to 30 MHz	2.2 dB
Radiated Emissions, H-field, 3 meters, 9 kHz to 30 MHz	2.7 dB
Radiated Emissions, E-field, 3 meters, 30 to 200 MHz	4.7 dB
Radiated Emissions, E-field, 3 meters, 200 to 1000 MHz	6.2 dB
Radiated Emissions, E-field, 3 meters, 1 to 6 GHz	5.0 dB
Radiated Emissions, E-field, 3 meters, 6 to 18 GHz	5.5 dB
Radiated Emissions, E-field, 3 meters, 18 to 26 GHz	5.9 dB
Bandwidth using marker delta method at a span of 20 MHz	8 kHz
99% Occupied Bandwidth using REC-43	1% of frequency span
Direct Amplitude measurement 1-26,000 MHz	1.5 dB
Temperature THM-02	0.6 Deg C

The uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2 in accordance with CISPR 16-4-2.
