

**TEST REPORT # 316398 WLAN**  
**LSR Job #: C-2664**

**Compliance Testing of:**

Carrier Infinity System Control Thermostat

**Test Date(s):**

2/8/17 – 3/24/17 & 5/25/17 - 6/9/17 & 7/13/17

**Prepared For:**

Attn: Gregg Householder  
United Technologies Electronic Controls Inc.  
3650 W 200 N  
Huntington, IN 46750

**This Test Report is issued under the Authority of:**

Coty Hammerer, EMC Engineer

### **1.3 -Laird Technologies, Inc. Test Lab in Review**

As an EMC Testing Laboratory, our Accreditation and Assessments are recognized through the following:

---

#### **A2LA – American Association for Laboratory Accreditation**

*Accreditation based on ISO/IEC 17025: 2005 with Electrical (EMC) Scope of Accreditation  
A2LA Certificate Number: 1255.01*

---

#### **Federal Communications Commission (FCC) – USA**

*Listing of two 3 Meter Semi-Anechoic Chambers based on Title 47 CFR – Part 2.948  
FCC Registration Number: 90756*

---

#### **Industry Canada**

*On file, 3 Meter Semi-Anechoic Chamber based on RSS-GEN – Issue 4  
File Number: IC 3088A-2  
On file, 3 Meter Semi-Anechoic Chamber based on RSS-GEN – Issue 4  
File Number: IC 3088A-3*

---

|                                                             |                                          |                   |

## EXHIBIT 2. PERFORMANCE ASSESSMENT

### **2.1 – Client Information**

|                    |                                            |
|--------------------|--------------------------------------------|
| Manufacturer Name: | United Technology Electronic Controls Inc. |
| Address:           | 3650 W 200 N<br>Huntington, IN 46750       |
| Contact Name:      | Gregg Householder                          |

### **2.2 - Equipment Under Test (EUT) Information**

The following information has been supplied by the applicant.

|                |                                            |
|----------------|--------------------------------------------|
| Product Name:  | Carrier Infinity System Control Thermostat |
| Model Number:  | SYSTXBBECC01-B                             |
| Serial Number: | Engineering Samples #26 and #33            |

### **2.3 - Associated Antenna Description**

The associated antenna is a chip antenna, a WiLink 8 CC1835 with a part # of ANT162442DT-2001A2. The peak antenna gain of this chip antenna is +2.1 dBi.

|                                                          |                                          |                   |
|----------------------------------------------------------|------------------------------------------|-------------------|
| Prepared For: United Technology Electronic Controls Inc. | Model #: SYSTXCCITC01-B                  | Report #: 316398  |
| EUT: Carrier Infinity System Controls Thermostat         | Serial #: Engineering Samples#26 and #33 | LSR Job #: C-2664 |

## 2.4 - EUT'S Technical Specifications

|                                               |                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------|
| EUT Frequency Range (in MHz)                  | 2412 – 2462 MHz                                                     |
| Type of Modulation                            | DSSS (802.11b)<br>OFDM (802.11g and n)                              |
| Transmitter Spurious (worst case) at 3 meters | 55.0 dBμV/m (Peak) at 4824 MHz, 53.28 dBμV/m (Average) at 4824 MHz  |
| Frequency Tolerance %, Hz, ppm                | Better than 100 ppm                                                 |
| Microprocessor Model # (if applicable)        | N/A                                                                 |
| Antenna Information                           |                                                                     |
| Detachable/non-detachable                     | Non-Detachable                                                      |
| Type                                          | Chip                                                                |
| Gain                                          | 2.1 dBi                                                             |
| EUT will be operated under FCC Rule Part(s)   | Title 47 part 15.247                                                |
| Modular Filing                                | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |

### Radio Characteristics

|                                                | 802.11 b | 802.11 g | 802.11 n |
|------------------------------------------------|----------|----------|----------|
| Maximum Average conducted Output Power (dBm)   | 15.94    | 15.54    | 16.949   |
| Maximum Average conducted Output Power (Watts) | 0.0393   | 0.0358   | 0.0495   |
| Minimum Average Conducted Output Power (dBm)   | 15.02    | 11.61    | 10.67    |
| Minimum Average Conducted Output Power (Watts) | 0.0318   | 0.0145   | 0.0117   |

## 2.5 - Product Description

### Product Description for Carrier Infinity System Control (BING)

The new Infinity System Control (SYSTXCCITC01-B) and Bryant Connex Control (SYSTXBBECC01-B) is the user interface and control for Infinity or Bryant system. The Infinity System Control communicates to other intelligent devices in the system, such as Furnace, fan coil, air conditioner and heat pump using a 4 wire digital communication interface (ABCD) bus.

The Infinity System Control offers the following hardware features:

1. A sleek, new flat glass design
2. 5" WQVGA landscape display at 480x272 resolution
3. An integrated capacitive touch interface with smart phone like response
4. On board flat lens infrared motion detector to support occupancy sensing
5. New Temperature / Humidity sensor for better performance
6. MicroSD card interface for flexible, concealed, mass storage area for pictures for wall control
7. WiFi (w/MIMO) and Bluetooth Low Energy (BLE) radio to support internet connection and wireless sensors for zone control

The Infinity System Control has a rich graphical menu system which offers the following application features.

|                                                          |                                          |                   |
|----------------------------------------------------------|------------------------------------------|-------------------|
| Prepared For: United Technology Electronic Controls Inc. | Model #: SYSTXCCITC01-B                  | Report #: 316398  |
| EUT: Carrier Infinity System Controls Thermostat         | Serial #: Engineering Samples#26 and #33 | LSR Job #: C-2664 |

1. 4 Programmable Comfort profiles – Home/Away/Sleep/Wake
2. Programmable schedule and Vacation menus
3. Energy Tracking information
4. Photo Upload capability to display
5. Zoning definition capability
6. Intelligent WiFi and BLE interface
7. Real time weather icon per zip code
8. Reminders for filter and accessories

There is an “i” button on each screen to help define what every button is for.

**Note:** For WLAN testing only the 2.4 GHz Band (802.11 b, g, and n) HT20 and 2.4 GHz MIMO (802.11 n) HT20 were tested during the specified test dates. The 5 GHz WLAN HT20 with and without Diversity along with the 2.4 GHz WLAN HT40 functionalities were not tested at any time.

**Note:** The AC Adapter/Transformer used to power the EUT throughout testing is not supplied with the unit. This power supply was for testing purposes only.

## EXHIBIT 4. CONFORMANCE SUMMARY

When tested between February 8<sup>th</sup> to March 24<sup>th</sup> of 2017 and May 25<sup>th</sup> to June 9<sup>th</sup> of 2017 and July 13<sup>th</sup> 2017, it was determined that the EUT, BING, was compliant to the requirements of:

FCC Title 47 CFR Part 15.247  
RSS 247 Issue 2

Using the methods of ANSI C63.10-2013, RSS GEN, and KDB 558074 D01 DTS Measurement Guidance v04.

Any modifications made to the EUT after the specified test date(s) will invalidate the data herein.

If some emissions measurements are seen to be within the uncertainty value, as listed in Appendix C there is a possibility that this unit may not meet the required limit specification if subsequently tested.

## EXHIBIT 5. UNWANTED EMISSIONS INTO THE RESTRICTED FREQUENCY BANDS.

### **5.1 - Test Setup**

The test setup was assembled in accordance with Title 47, CFR FCC Part 15 and ANSI C63.10-2013. The EUT was placed on a 150 cm high non-conductive pedestal (80 cm for measurements under 1 GHz), centered on a flush mounted turntable inside a 3 meter Semi-Anechoic Chamber. The EUT was operated in continuous transmit mode. The unit was tested on the low, middle and high channels, controllable via proprietary software provided by the manufacturer.

The applicable limits apply at a 3 meter distance. The calculations to determine these limits are detailed in the following pages. Please refer to Appendix A for a complete list of test equipment. The test sample was operated on one of three (3) standard channels to comply with FCC Part 15.31(m).

### **5.2 - Test Procedure**

Radiated RF measurements were performed on the EUT in a 3 meter Semi-Anechoic, FCC listed Chamber. The frequency range from 30 MHz to 25000 MHz was scanned and investigated. The radiated RF emission levels were manually noted at the various fixed degree settings of azimuth on the turntable and antenna height. The EUT was placed on a non-conductive pedestal in the 3 meter Semi-Anechoic Chamber, with the antenna mast placed such that the antenna was 3 meters from the EUT. A Biconical Antenna was used to measure emissions from 30 MHz to 200 MHz, and a Log Periodic Antenna was used to measure emissions from 200 MHz to 1000 MHz. A Double-Ridged Waveguide Horn Antenna was used from 1 GHz to 18 GHz while a standard gain horn antenna was used in the 18 GHz to 25 GHz range. The maximum radiated RF emissions between 30MHz to 25 GHz were found by raising and lowering the sense antenna between 1 and 4 meters in height, using both horizontal and vertical antenna polarities. A tilt gear was utilized to keep the EUT within the cone of radiation for measurements above 1 GHz. Attenuating foam lined the chamber floor between the EUT and Mast for measurements above 1 GHz.

The EUT was positioned in a single orientation in which it is intended to be installed.

|                                                             |                                          |                   |
|-------------------------------------------------------------|------------------------------------------|-------------------|
| Prepared For: United Technology<br>Electronic Controls Inc. | Model #: SYSTXCCITC01-B                  | Report #: 316398  |
| EUT: Carrier Infinity System<br>Controls Thermostat         | Serial #: Engineering Samples#26 and #33 | LSR Job #: C-2664 |

### **5.3 - Test Equipment Utilized**

A list of the test equipment and antennas utilized for the Radiated Emissions test can be found in Appendix A. This list includes calibration information and equipment descriptions. All equipment is calibrated and used according to the operation manuals supplied by the manufacturers. All calibrations of the antennas used were performed at a calibration laboratory accredited to ISO 17025, and are traceable to the SI standard. The resulting correction factors and the cable loss factors from these calibrations were entered into the EMI Receiver database. As a result, the data taken from the EMI Receiver accounts for the antenna correction factor as well as cable loss or other corrections, and can therefore be entered into the database as a corrected meter reading. The EMI Receiver was operated with a resolution bandwidth of 120 kHz for measurements below 1 GHz (video bandwidth of at least 300 kHz), and a resolution bandwidth of 1 MHz for measurements above 1 GHz (video bandwidth of at least 3 MHz). For some plots, a reduced video bandwidth was used in order to identify spurious emissions (The relevant plots are labeled as such). In these cases, the standard video bandwidth was used with the appropriate detectors for measurement.

### **5.4 - Test Results**

The EUT was found to **MEET** the Radiated Emissions requirements of Title 47 CFR, FCC Part 15.247 and RSS 247 for a DTS transmitter. The frequencies with significant RF signal strength were recorded and plotted as shown in the Data Charts and Graphs.

|                                                             |                                          |                   |

## **5.5 - Calculation of Radiated Emissions Limits and reported data.**

### **Reported data:**

For both fundamental and spurious emissions measurement, the data reported includes all necessary correction factors. These correction factors are loaded onto the EMI receiver when measurements are performed.

**Reported Measurement data = Raw receiver measurement (dB $\mu$ V) + Antenna correction Factor + Cable factor (dB) + Miscellaneous factors when applicable (dB) – amplification factor when applicable (dB).**

### **Generic example of reported data at 200 MHz:**

**Reported Measurement data = 18.2 (raw receiver measurement) + 15.8 (antenna factor) + 1.45 (cable factor) = 35.45 (dB $\mu$ V/m).**

As specified in 15.247 (d), radiated emissions that fall within the restricted band described in 15.205(c) for FCC must comply with the general emissions limit.

The following table depicts the general radiated emission limits above 30 MHz. These limits are obtained from Title 47 CFR, Part 15.209, for radiated emissions measurements. These limits were applied to any signals found in the 15.205 restricted bands. The mentioned limits correspond to those limits listed in RSS GEN.

| Frequency<br>(MHz) | 3 m Limit<br>$\mu$ V/m | 3 m Limit<br>(dB $\mu$ V/m) | 1 m Limit<br>(dB $\mu$ V/m) |
|--------------------|------------------------|-----------------------------|-----------------------------|
| 30-88              | 100                    | 40.0                        | -                           |
| 88-216             | 150                    | 43.5                        | -                           |
| 216-960            | 200                    | 46.0                        | -                           |
| 960-40,000         | 500                    | 54.0                        | 63.5                        |

Sample conversion of field strength ( $\mu$ V/m to dB $\mu$ V/m):

$\text{dB}\mu\text{V/m} = 20 \log_{10} (100) = 40 \text{ dB}\mu\text{V/m}$  (from 30-88 MHz)

|                                                             |                                          |                   |

## EXHIBIT 6. CONDUCTED EMISSIONS TEST, AC POWER LINE

### 6.1 Test Setup

The test area and setup are in accordance with ANSI C63.10 and with Title 47 CFR, FCC Part 15/ The EUT was placed on a non-conductive wooden table, with a height of 80 cm above the reference ground plane. The power supply was then plugged into a 50 $\Omega$  (ohm) Line Impedance Stabilization Network (LISN). The AC power supply was provided via an appropriate broadband EMI Filter, and then to the LISN line input. Final readings were then taken and recorded. After the EUT was setup and connected to the LISN, the RF Sampling Port of the LISN was connected to an EMI receiver System. The LISN used has the ability to be switched between either L1 (line) or L2 (neutral).

### 6.2 Test Procedure

The EUT was investigated in continuous modulated transmit mode for this portion of the testing. The appropriate frequency range and bandwidths were selected on the EMI Receiver, and measurements were made. The bandwidth used for these measurements is 9 kHz for Quasi-Peak and Average detectors in the frequency range of 150 kHz to 30 MHz. Final readings were then taken and recorded.

### 6.3 Test Equipment Utilized

A list of the test equipment and accessories utilized for the Conducted Emissions test is provided in Appendix A. This list includes calibration information and equipment descriptions. All equipment is calibrated and used according to the operation manuals supplied by the manufacturers. The emissions are measured on the EMI System, which contains correction factors to account for the equipment used in measurements.

### 6.4 Test Results

The EUT was found to **MEET** the Conducted Emission requirements of FCC Part 15.207 for Conducted Emissions for an Intentional Radiator. See the Data Charts and Graphs for more details of the test results.

**Note:** The following data is representative of the worst case emissions. MCS8 (MIMO) with the middle channel selected was found to generate the highest emissions. Changing to the low and high channel of the EUT showed no difference in emissions.

## 6.8 Screen Captures – Conducted Emissions Test

These screen captures represent the worst-case Peak Emissions. For conducted emission measurements, both a Quasi-Peak detector function and an Average detector function are utilized.

## EXHIBIT 7. OCCUPIED BANDWIDTH

Test Engineer(s): Shane Dock

### **7.1 - Limits**

For a DTS system operating in the 2400 to 2483.5 MHz band, the minimum 6dB emission bandwidth limit is 500 kHz.

### **7.2 - Method of Measurements**

For this portion of the tests, a direct measurement of the transmitted signal was performed at the antenna port of the EUT, via a cable connection to a spectrum analyzer. An attenuator was placed in series with the cable to protect the spectrum analyzer. The loss from the cable and the attenuator were added on the analyzer as gain offset settings there by allowing direct measurements, without the need for any further corrections. The EUT was configured to run in a continuous transmit mode, while being supplied with typical data as a modulation source. A bandwidth measurement function that is built into the spectrum analyzer was used to measure the 20dB/emission bandwidth while the 6dB bandwidth was measured using **FCC OET KDB 558074 section 8**.

## EXHIBIT 8. BAND EDGE MEASUREMENTS

Test Engineer(s): Coty Hammerer

### **8.1 - Method of Measurements**

FCC 15.247 require a measurement of spurious emission levels at the restricted band to be compliant to the general emissions limit, in particular at the Band-Edges where the intentional radiator operates. The EUT was operated in continuous transmit mode with continuous modulation, with internally generated data as the modulating source. The EUT was operated at the lowest channel for the investigation of the lower Band-Edge, and at the highest channel for the investigation of the higher Band-Edge.

The Band-edge measurements were performed conducted (100 kHz bandwidth) and radiated. The measurement of band-edge was performed to satisfy FCC 15.247(d).

**Per FCC KDB 558074 D01 Measurement Guidance v04 (section 11)**, conducted measurements were performed with 100 kHz bandwidth for all emissions outside of the band of operation. For measuring radiated emissions in the restricted band, a bandwidth of 120 kHz (below 1000MHz) or 1MHz (above 1000MHz) was used in accordance with C63.4.

For both conducted and radiated measurements, correction factors and the cable loss factors were entered into the EMI Receiver database. **As a result, the plots taken from the EMI Receiver accounts for all applicable correction factor as well as cable loss, and can therefore be entered into the database as a corrected meter reading.**

### **8.2. Band Edge Screen Captures.**

The data presented below are samples selected from the various data rates and channels tested.
