4.1.3 Test procedures

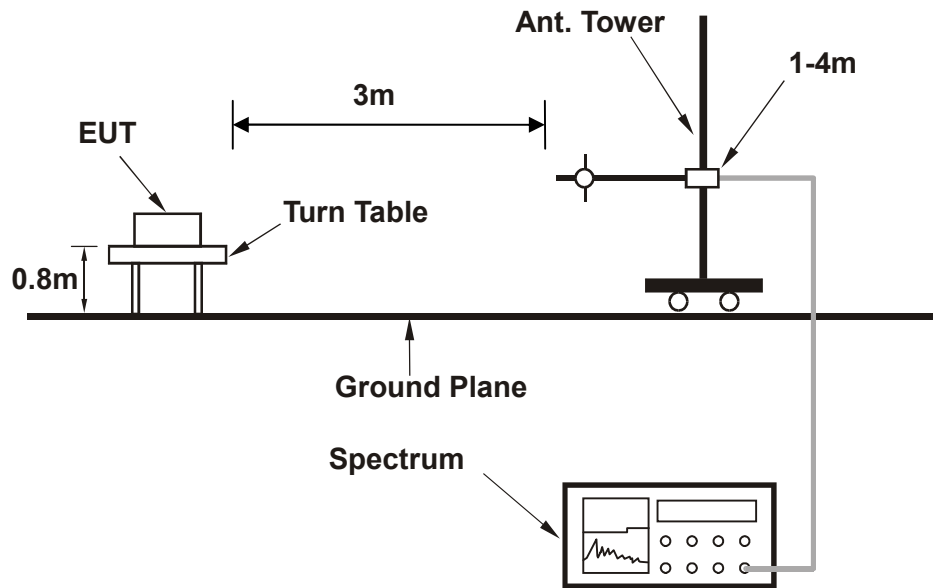

The basic test procedure was in accordance with ANSI C63.10 (section 12).

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meters Semi-anechoic chamber room. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The height of antenna is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to peak detect function and specified bandwidth with maximum hold mode when the test frequency is below 1 GHz.
- f. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, For battery operated equipment, the equipment tests shall be perform using fresh batteries. The turntable was rotated to maximize the emission level.

4.1.4 Deviation from test standard

No deviation

4.2 Test setup

For the actual test configuration, please refer to the attached file (Test Setup Photo).

4.2.1 EUT operating conditions

- Placed the EUT on the testing table.

4.3.4 Test setup

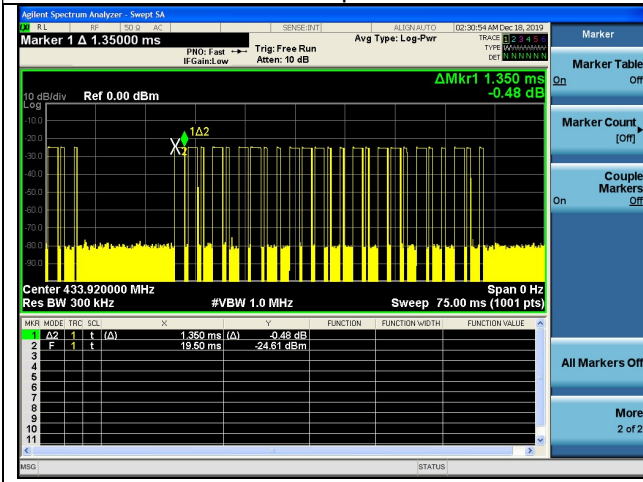

4.3.5 Test results

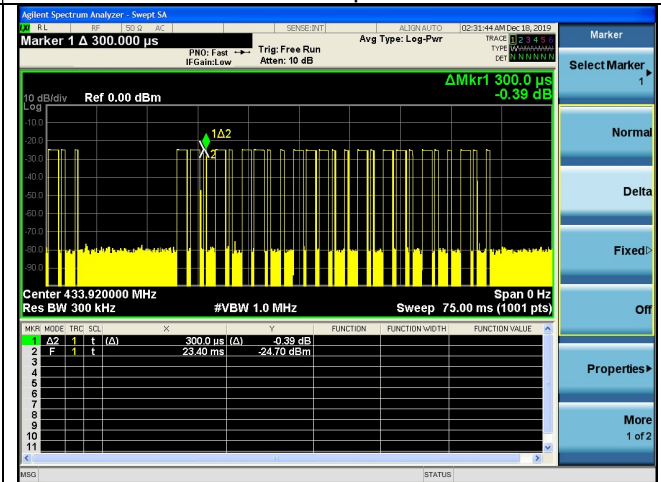

$T_p = 60.80\text{ms}$
 $T_{on} = 21.15\text{ms}$
 $T_{off} = T_p - T_{on} = 60.80 - 21.15\text{ms} = 39.65\text{ms}$
 $\text{Duty Cycle} = T_{on} / T_{periods} * 100\% = 21.15 / 60.80 * 100\% = 34.78\%$
 $\text{Factor} = 20 * \text{Log}(T_{on} / T_p) = -9.17\text{dB}$
 The pulse desensitization correction factor:
 $\text{RBW}(3\text{MHz}) > (2/PW)$ therefore PDCF is not needed. $2/PW = 2/0.30 = 6.66\text{kHz}$

$T_{on1} = 1.35\text{ms}$
 $\text{Total} = 1.35\text{ms} * 13 \text{ pulse} = 17.55\text{ms}$

$T_{on2} = 0.3\text{ms}$
 $\text{Total} = 0.3\text{ms} * 12 \text{ pulse} = 3.6\text{ms}$

4.4 20dB Bandwidth measurement

4.4.1 Limit of 20dB bandwidth measurement

According to FCC 15.231(c), The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. Bandwidth is determined at the points 20 dB down from the modulated carrier.

Limit=Fundamental Frequency×0.25%=433.92MHz×0.25%=1084.8 kHz

4.4.3 Test procedure

The spectrum analyzer was receiving the maximum emission level. The 20dB bandwidth is defined as the total spectrum the power of which is higher than peak power minus 20dB.

4.4.4 Deviation from test standard

No deviation.

4.4.5 Test Setup

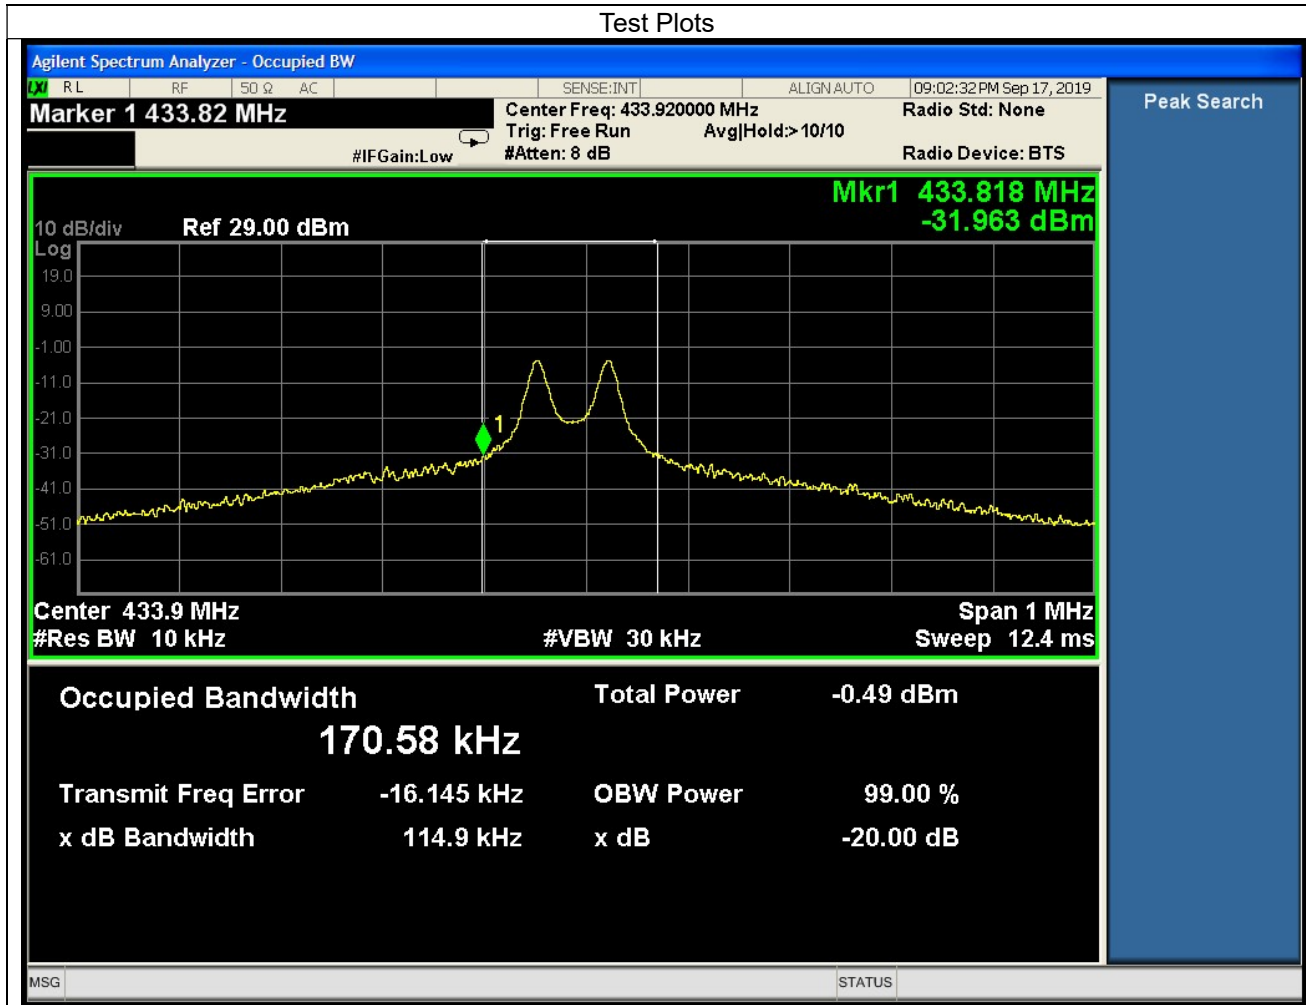

4.4.6 EUT operating conditions

- Placed the EUT on the testing table.
- Enable EUT under transmission condition continuously at specific channel frequency.

4.4.7 Test Results

Frequency (MHz)	20dB bandwidth (kHz)	Maximum limit (kHz)	Pass/Fail
433.92	114.9	1084.8	PASS

4.5 Deactivation test

4.5.1 Limits of deactivation test

15.231 (a)(1) A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

15.231 (a)(2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.

4.5.3 Test Procedure

With the EUT's antenna attached, the EUT's output signal was received by the test antenna, which was connected to the spectrum analyzer. Set the center frequency to 433.92MHz, than set the spectrum analyzer to Zero Span for the release time reading. During the testing, the transmission duration was measured and recorded.

4.5.4 Deviation from test standard

No deviation.
