

## **RF exposure**

According to 447498 D01 General RF Exposure Guidance v06

The 1-g and 10-g SAR test exclusion thresholds for 100 Mz to 6 Gz at test separation distances  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] $\cdot [\sqrt{f(\mathbb{H}_2)}] \le 3.0 \text{ for } 1-g \text{ SAR and } \le 7.5 \text{ for } 10-g \text{ extremity SAR},$ 

Where;

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest  $\mathbb{N}$  and mm before calculation The result is rounded to one decimal place for comparison

| Frequency (趾) | Distance<br>(mm) | Max tune-up power (dBm) |      | Calculation | Exclusion |
|---------------|------------------|-------------------------|------|-------------|-----------|
|               |                  | (dBm)                   | (mW) | value       | Threshold |
| 2.402         | 5                | 1                       | 1.26 | 0.39        | ≤3.0      |
| 2.442         | 5                | 1                       | 1.26 | 0.39        | ≤3.0      |
| 2.480         | 5                | 1                       | 1.26 | 0.39        | ≤3.0      |
