# 1.0 INTRODUCTION

#### 1.1 Scope

The purpose of this report is to present the results of compliance testing performed in accordance with FCC Part 15.247, ANSI C63.4-2014 and ANSI C63.10-2013 to gain FCC Certification Authorization for Low-Power License-Exempt transmitters. All test procedures, limits, criteria, and results described in this report apply only to the Tektelic Communication Inc. BLE TRACKER test sample, referred to herein as the EUT (Equipment Under Test).

The sample has been provided by the customer.

This report does not imply product endorsement by the Electronics Test Centre, A2LA, nor any Canadian Government agency.

#### 1.2 Applicant

This test report has been prepared for Tektelic Communication Inc., located in Calgary, Alberta, Canada.

#### 1.3 Test Sample Description

Product Name:		BLE TRACKER
	Frequency Band	902 – 928 MHz
	Type of Modulation	Chirp Spread Spectrum
LoRa Radio	BW/Frequency Range	DTS 500kHz, 903 – 914.2 MHz
	Associated Antenna	Omni directional, 2.0dBi gain, chip antenna
	Detachable/Non Detachable	Non-Detachable (internal to product)
Model# / Serial#		T0005944 / 2007K0010
Power supply:		Internal Battery

As provided to ETC (Airdrie) by Tektelic Communication Inc.:

**Note:** All three channels / axis for T0005944 in DTS mode were evaluated. Worse Channel / Axis were selected for detail analysis for radiated emission.

#### 1.4 General Test Conditions and Assumptions

The EUT was set up and exercised using the configurations, modes of operation and arrangements defined in this report only. All inputs and outputs to and from other equipment associated with the EUT were adequately simulated.

In this report, the EUT is only tested for the DTS 500 kHz transmission. Test results regarding Hybrid 125 kHz transmission mode is provided in the separate report.

The environmental conditions are recorded during each test and are reported in the relevant sections of this document.

#### Modulation mode: DTS 500 kHz:

DTS modulation system is operating in non-frequency hopping. The channels used for the tests are: Low = 903MHz MID = 907.9MHz High. =914.2 MHz

## 1.5 Scope of Testing

Tests were performed in accordance with FCC Part 15.247, ANSI C63.4: 2014, ANSI C63.10: 2013 as referenced in FCC OET KDB 558074 D01 15.247 Measurement Guidance v05r02.

The EUT was also tested as an unintentional radiator, as reported separately.

#### 1.5.1 Test Methodology

Test methods are specified in the Basic Standard as referenced and/or modified by the Product Standard in the part of Section 2 of this report associated with each particular test case.

## 1.5.2 Variations in Test Methodology

Any variance in methodology or deviation from the reference Standard is documented in the part of Section 2 of this report associated with each particular Test Case.

## **1.5.3 Test Sample Verification, Configuration & Modifications**

EUT setup, configuration, protocols for operation and monitoring of EUT functions, and any modifications performed in order to meet the requirements, are detailed in each Test Case of Section 2 of this report.

#### 1.5.4 Uncertainty of Measurement:

The factors contributing to uncertainty of measurement are identified and calculated in accordance with UKAS (United Kingdom Accreditation Service) document "Lab 34, The Expression of Uncertainty in EMC Testing, Aug 2002." as based on the "ISO Guide to the Expression of Uncertainty in Measurement, 1995."

This uncertainty estimate represents an expended uncertainty expressed at approximately 95% confidence using a coverage factor of k = 2.

Test Method	Uncertainty
Radiated Emissions Level (9 KHz – 1 GHz)	±4.6 dB
Radiated Emissions Level (1 GHz – 26.5 GHz)	±5.31 dB
Conducted Emissions Level (150 KHz – 30 MHz)	±2.7 dB
Uncertainty Conducted Power level	±0.5 dB
Uncertainty Conducted Spurious emission level	±0.6 dB
Uncertainty for Bandwidth test	±1.5 %

## 2.0 TEST CONCLUSION

#### STATEMENT OF COMPLIANCE

# The customer equipment referred to in this report was found to comply with the requirements, as summarized below.

The EUT was subjected to the following tests. Compliance status is reported as **Compliant** or **Non-compliant**. **N/A** indicates the test was Not Applicable to the EUT.

**Note:** Maintenance of compliance is the responsibility of the Manufacturer. Any modifications to the product should be assessed to determine their potential impact on the compliance status of the EUT with respect to the standards detailed in this test report.

The following table summarizes the tests performed in terms of the specification, class or performance criterion applied, and the EUT modification state.

Test Case	Test Type	Specification	Test Sample	Modifications	Config.	Result
	Frequency Range = (903 – 914.2) MHz 500 KHz DTS Mode Max. Conducted Tx Power =15.27dBm (0.03365)Watt					
2.1	AC Conducted Emissions (Tx)	15.207	BLE TRACKER	none	see § 2.1	n/a
2.2	Occupied Bandwidth	15.247(a)(1) 15.247(2)(2)	BLE TRACKER	none	see § 2.2	Compliant
2.3	Max Average Output Power Conducted	15.247(b)	BLE TRACKER	none	see § 2.3	Compliant
2.4	Power Spectral Density	15.247(e) 15.247(f)	BLE TRACKER	none	see § 2.4	Compliant
2.5	Band Edge	15.247(d)	BLE TRACKER	none	see § 2.5	Compliant
2.6	Conducted Spurious Emission in Non-Restricted Band	15.247(d)	BLE TRACKER	none	see § 2.6	Compliant
2.7	EUT Position	ANSI C63.4	BLE TRACKER	none	see § 2.7	Assessed
2.8	Radiated Spurious Emission in Restricted Band (Tx Mode)	15.205, 15.209 15.247(d)	BLE TRACKER	none	see § 2.8	Compliant
2.9	RF Exposure	15.247(i)	BLE TRACKER	none	see § 2.9	Exempt

Refer to the test data for applicable test conditions.

**Test Personnel:** 

# 2.1 AC Power Line Conducted Emissions

Test Lab: Electronics Test Centre, Airdrie

EUT: BLE TRACKER Standard: FCC Part 15.207

Date:

Basic Standard: ANSI C63.10: 2013

# **EUT status: Compliant**

**Comments:** Comments: Kona BTLE tracker is battery powered and there is no direct connection to Main.

# 2.2 Channel Occupied Bandwidth (DTS Mode)

Date: 2020-03-16 (23.1°C,9.0% RH)	Basic Standard: ANSI C63.10-2013 KDB 558074 D01 15.247 Measurement Guidance v05r02
Test Personnel: Bushra Muharram	Standard: FCC PART 15.247
Test Lab: Electronics Test Centre, Airdrie	EUT: BLE TRACKER

# **EUT status: Compliant**

## Specification: FCC Part 15.247 (a, 2), FCC 15.215 (c)

**Criteria:** Systems using digital modulation techniques may operate in the 902-928 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

#### 2.2.1 Test Guidance: FCC KDB 558074 D01 15.247 Measurement Guidance v05r02/ ANSI C63.10 clause 11.8

This measurement is performed at low, mid and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

Use the following spectrum analyzer settings:				
Span	between two times and five times the channel center frequency OBW			
RBW	100 KHz			
VBW	Set the VBW $\geq$ [3 x RBW].			
Sweep	Auto Couple			
Detector function	peak			
Trace mode	max hold			
Allow the trace to stabilize. The automatic bandwidth measurement capability of an				
instrument employed using the X dB bandwidth mode with X set to 6 dB				

#### 2.2.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

#### 2.2.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date (yyyy-mm-dd)	Cal. Due (yyyy-mm-dd)
MXE EMI Receiver	Keysight Technologies Inc	N9038A FW A 22.08	6906	2019-10-29	2020-10-29
Temp/Humidity	Extech	42270	5892	2019-04-05	2020-04-05
Attenuator	FairView Microwave	SA18N5WA-10	6886	2020-02-01	2021-02-01
DC Blocker	MCL	BLK-89-S+	-	2020-02-01	2021-02-01
CE Cable (50cm length)	Huber+Suhner	Enviroflex 400	-	2020-02-01	2021-02-01

# 2.2.4 Test Sample Verification, Configuration & Modifications

The EUT was set to transmit continuously on a selected channel with test-specific software. The output was modulated as in normal operation. The EUT modified to provide the direct access to antenna port for conducted measurements.

For compliance purposes EUT met requirements without any modification

There is no Deviation and exclusions from test specifications.

#### Test setup diagrams for Occupied Bandwidth testing:

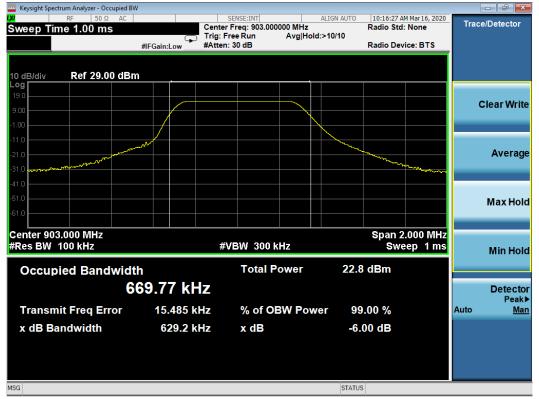

#### Conducted:

#### 2.2.5 Channel Occupied Bandwidth Data: (DTS Mode) Lora 500 KHz Channels

Channel	Freq. [MHz]	6 dB OBW [kHz]	99% OBW [KHz]	Limit 6 dB OBW
Low	903	629.2	669.77	≥ 500 KHz
Mid	907.8	635.9	679.43	≥ 500 KHz
High	914.2	637.1	679.20	≥ 500 KHz

## 2.3 Maximum conducted (average) output power (DTS Mode)

Test Lab: Electronics Test Centre, Airdrie	EUT: BLE TRACKER
Test Personnel: Bushra Muharram	Standard: FCC PART 15.247
Date: 2020-03-16 (23.1°C,9.0% RH)	Basic Standard: ANSI C63.10: 2013 KDB 558074 D01 15.247 Measurement Guidance v05r02

# **EUT status: Compliant**

## Specification: FCC Part 15.247(b, 3)

**Criteria** For systems using digital modulation in the 902-928 MHz bands: 1 Watt.

#### 2.3.1 Test Guidance: FCC KDB 558074 D01 15.247 Measurement Guidance v05r02/ ANSI C63.10 Sub clause 11.9.2.2

This measurement is performed at low, mid and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

Output Power Method AVGSA-1				
Span	≥ 1.5 times the OBW			
RBW	$1 - 5$ % of the OBW, $\leq 1$ MHz			
VBW	≥ 3 x RBW			
Number of Points in sweep	≥ 2 x Span / RBW			
Sweep time	Auto			
Detector	RMS (Power Averaging)			
Sweep trigger	Free Run (If Duty Cycle ≥98%)			
Trace Average	At least 100 traces in power Averaging (RMS)			
Power measured	Integrated the spectrum across the OBW of the signal using the S/A band power measurement function, with band limit set equal to the OBW band edge.			

#### 2.3.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

#### 2.3.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date (yyyy-mm-dd)	Cal. Due (yyyy-mm-dd)
MXE EMI Receiver	Keysight Technologies Inc	N9038A FW A 22.08	6906	2019-10-29	2020-10-29
Temp/Humidity	Extech	42270	5892	2019-04-05	2020-04-05
Attenuator	FairView Microwave	SA18N5WA-10	6886	2020-02-01	2021-02-01
DC Blocker	MCL	BLK-89-S+	-	2020-02-01	2021-02-01
CE Cable (50cm length)	Huber+Suhner	Enviroflex 400	-	2020-02-01	2021-02-01

## 2.3.4 Test Sample Verification, Configuration & Modifications

The EUT was set to a selected channel with test-specific software. The output was modulated as in normal operation.

The EUT modified to provide the direct access to antenna port for conducted measurements.

For compliance purposes EUT met requirements without any modification

EUT: BLE TRACKER

Standard: FCC PART 15.247

Basic Standard: ANSI C63.10: 2013 KDB 558074 D01 15.247 Measurement Guidance v05r02

# **EUT status: Compliant**

## Specification: FCC Part 15.247(e)

**Criteria** For digitally modulated systems the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

# 2.4.1 Test Guidance: FCC KDB 558074 D01 15.247 Measurement Guidance v05r02/ Sub clause 11.10 of ANSI C63.10

This measurement is performed at low, mid and high frequencies, in continuous transmission, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

Use the following s	Use the following spectrum analyzer settings:				
Span	At least 1.5 times the OBW.				
RBW	3 KHz				
VBW	Set the VBW $\geq$ [3 x RBW].				
Sweep	Auto Couple				
Detector function	Power averaging (RMS) or sample detector (when RMS not available).				
Trace mode	Employ trace averaging (RMS) mode over a minimum of 100 traces.				
Allow the trace to amplitude level.	Allow the trace to stabilize. Use the peak marker function to determine the maximum				

#### 2.4.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

#### 2.4.3 Test Equipment

Testing was performed with this equipment:

## 2.5 Band Edge Attenuation (DTS Mode)

Test Lab: Electronics Test Centre, Airdrie

Test Personnel: Bushra Muharram

Date: 2020-03-16 (23.1°C,9.0% RH)

EUT: BLE TRACKER

Standard: FCC PART 15.247

Basic Standard: ANSI C63.10: 2013 KDB 558074 D01 15.247 Measurement Guidance v05r02

# **EUT status: Compliant**

## Specification: FCC Part 15.247(d)

**Criteria:** In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

# 2.5.1 Test Guidance: ANSI C63.10-2013 Clause 11.11, 11.13.2 / FCC KDB 558074 D01 15.247 Measurement Guidance v05r02 Clause 8.7

This measurement is performed at the low and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

Use the following s	spectrum analyzer settings:					
Span	That encompasses both the peak of the fundamental emission and the					
	band-edge emission under investigation.					
RBW	1% of the total span					
VBW	Set the VBW ≥ [3 × RBW].					
Sweep	Auto Couple					
Detector function	Peak					
Trace mode	Max Hold.					
Allow the trace to amplitude level.	stabilize. Use the peak marker function to determine the maximum					

# 2.5.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

# 2.5.3 Test Equipment

Testing was performed with the following equipment:

Equipment	Manufacturer	Model #	Asset #	Cal. Date (yyyy-mm-dd)	Cal. Due (yyyy-mm-dd)
MXE EMI Receiver	Keysight Technologies Inc	N9038A FW A 22.08	6906	2019-10-29	2020-10-29
Temp/Humidity	Extech	42270	5892	2019-04-05	2020-04-05

Date: 2020-03-16 (23.1°C,9.0% RH)	Basic Standard: ANSI C63.4-2014 KDB 558074 D01 15.247 Measurement Guidance v05r02

# **EUT status: Compliant**

#### Specification: FCC Part 15.247(d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

# 2.6.1 Test Guidance: ANSI C63.10-2013, Clause 11.11, FCC KDB 558074 D01 15.247 Measurement Guidance v05r02 Clause 8.5

This measurement is performed at the low, mid and high frequencies, with modulation.

The RF output of EUT with an antenna connector is fed to the input of the spectrum analyzer through appropriate attenuation. The loss from the cable and the attenuator were added on the analyzer as gain offset setting there by allowing direct measurements, without the need for any further corrections.

The spectrum analyzer is stepped through the spectrum in frequency spans selected to ensure acceptable frequency resolution. The RBW is set to 100 kHz. The VBW is set to  $\geq 300$  kHz. The Peak detector is used, with the trace set to Max Hold.

#### 2.6.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

#### 2.6.3 Test Equipment

Equipment	Manufacturer	Model #	Asset #	Cal. Date (yyyy-mm-dd)	Cal. Due (yyyy-mm-dd)
MXE EMI Receiver	Keysight Technologies Inc	N9038A FW A 22.08	6906	2019-10-29	2020-10-29
Temp/Humidity	Extech	42270	5892	2019-04-05	2020-04-05
Attenuator	FairView Microwave	SA18N5WA-10	6886	2020-02-01	2021-02-01
DC Blocker	MCL	BLK-89-S+	-	2020-02-01	2021-02-01
CE Cable (50cm length)	Huber+Suhner	Enviroflex 400	-	2020-02-01	2021-02-01

Testing was performed with the following equipment:

# 2.6.4 Test Sample Verification, Configuration & Modifications

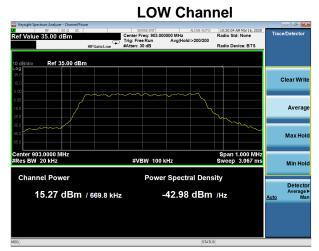

The EUT was set to a selected channel with test-specific software. The output was modulated as in normal operation. The EUT met the requirements without modification.

The EUT modified to provide the direct access to antenna port for conducted measurements

## 2.7 EUT Positioning Assessment

Test Lab: Electronics Test Centre, Airdrie

Test Personnel: Imran Akram

Standard: FCC PART 15.247

**EUT: BLE TRACKER** 

Date: 2020-03-16 (20.5°C,8.9% RH)

Basic Standard: ANSI C63.4-2014

# Y-Axis Found worse

Comments: EUT oriented in three axis's and Y- axis found to be worse emission axis. .

#### Specification: ANSI C63.4-2014, Clause 6.3.2.1

Portable, small, lightweight, or modular devices that may be handheld, worn on the body, or placed on a table during operation shall be positioned on a non-conducting platform, the top of which is 80 cm above the reference ground plane. The preferred area occupied by the EUT arrangement is 1 m by 1.5 m, but it may be larger or smaller to accommodate various sized EUTs (see Figure 6, Figure 7, and Figure 9). For testing purposes, ceiling- and wall-mounted devices also shall be positioned on a tabletop (see also 6.3.4 and 6.3.5). In making any tests involving handheld, body-worn, or ceiling-mounted equipment, it is essential to recognize that the measured levels may be dependent on the orientation (attitude) of the three orthogonal axes of the EUT. Thus, exploratory tests as specified in 8.3.1 shall be carried out for various axes orientations to determine the attitude having maximum or near-maximum emission level.

Refer to Test Setup photo exhibit.

#### 2.8 Radiated Spurious Emissions in restricted frequency bands (TX Mode)

#### Test Lab: Electronics Test Centre, Airdrie

**Test Personnel:** Bushra Muharram, Imran Akram, David Szczesniak

EUT: BLE TRACKER

Akram, Standard: FCC PART 15.247

Date: 2020-03-16/17/18 (20.1°C,10.7 % RH)

Basic Standard: ANSI C63.10-2013

# EUT status: Compliant

## Specification: FCC PART 15.247(d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

### 2.8.1 Test Guidance: ANSI C63.10-2013, Clause 11.12 / KDB 558074 D01 15.247 Measurement Guidance v05r02 Clause 8.6

From 9 kHz to 150 kHz (resolution bandwidth of 200 Hz) and from 150 kHz to 30 MHz (resolution bandwidth 9 kHz) measurements are performed with a loop antenna (as per KDB 460108).

From 30 MHz to 1000 MHz, measurements are performed with a broadband biconilog antenna and a resolution bandwidth of 120 kHz.

Above 1000 MHz, measurements are performed with a DRG Horn antenna or a Standard Gain horn, and a resolution bandwidth of 1 MHz. The EUT is raised to 150 cm above the ground plane, and the area between the EUT and the antenna mast is covered with RF absorbent material.

The scan is performed at discrete increments of turntable azimuth and antenna height, which are selected in accordance with the applicable standard in order to assure capture of frequencies of interest. Optimization is performed based on the scan data.

Frequencies having peak emissions within 10dB of the limits are optimized. The EUT is rotated in azimuth over 360 degrees and the direction of maximum emission is noted.

Antenna height is varied from 1 - 4 meters at this azimuth to obtain the maximum emission. Then the maximum level is measured with the appropriate detector and recorded. Up to 1 GHz, measurements are performed with a Quasi-Peak detector. Above 1 GHz, measurements are recorded with Peak and/or Average detectors, as applicable.

# 2.8.2 Deviations From The Standard:

There were no deviations from the EUT setup or methodology specified in the standard.

## 2.8.4 Test Equipment

Testing was performed with the following equipment:

#### FCC Part 15.205 Restricted Bands of Operation:

<sup>1</sup> Until February 1, 1999, this restricted band shall be 0.490-0.510 MHz, <sup>2</sup> Above 38.6

The field strength of emissions appearing within these frequency bands shall not exceed the limits shown in 15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in 15.209 shall be demonstrated based on the average value of the measured emissions.

#### Specification: FCC15.209 Radiated emission limits.

Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009 - 0.490	2400/F(kHz)	300
0.490 - 1.705	24000/F(kHz)	30
1.705 - 30.0	30	30
30 - 88	100	3
88 - 216	150	3
216 - 960	200	3
Above 960	500	3

### 2.8.6 Radiated Emissions Data:

The emissions data are presented in tabular form, showing turntable azimuth, antenna height and polarization, the uncorrected spectrum analyzer reading, the correction factors applied, the net result, the value of the limit at the frequency investigated, and the Delta between the result and the limit.

# Meter Reading in dB $\mu$ V + Antenna Factor in dB/m + Gain/Loss Factor in dB = Corrected Field Strength in db $\mu$ V/m.

#### Delta = Field Strength - Limit

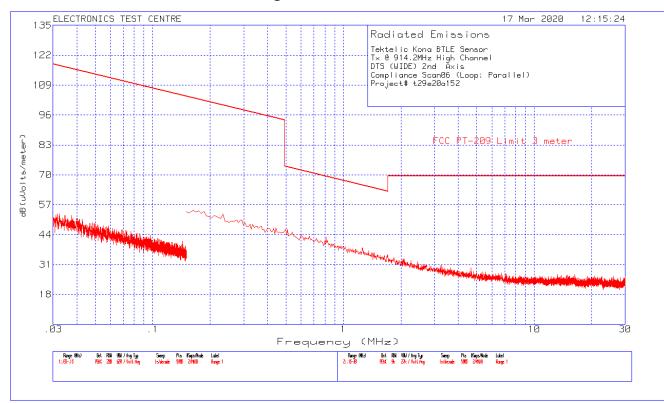

- **Notes:** When a preamp is used, the resulting gain is compensated, producing a negative value for the Cable Loss.
  - Measurements reported are the result of adjusting the turntable azimuth and antenna height to obtain the maximum EUT emission. This may produce a different reading than the plot trace. The plot is a Peak Hold function obtained at discrete increments of height and azimuth, while the reported measurement is obtained with the appropriate Quasi Peak or Average detector after the height and azimuth have been adjusted for maximum emission.
  - Preliminary scans were performed for all channels in Transmit modes. The High band channel 914.2 MHz was selected as the worst-case condition for detailed examination.
  - In Transmit mode, the EUT was assessed up to 10.0 GHz.

	Negative values for Deita indicate compliance.

#### 2.9 RF Exposure

Test Lab: Electronics Test Centre, AirdrieEUT: BLE TRACKERTest Personnel:Standard: FCC PART 15.247Date:Standard: FCC PART 15.247

# EUT status: Exempt

Compliant: RF exposure assessment to be provided in a separate Exhibit.

# 3.0 TEST FACILITY

## 3.1 Location

The BLE TRACKER was tested for emissions at the Electronics Test Centre laboratory located in Airdrie, Alberta, Canada. The Radio Frequency Anechoic Chamber (RFAC), identified as Chamber 1, has a usable working space measuring 10.6 m long x 7.3 m wide x 6.5 m high.

Measurements taken at this site are accepted by Industry Canada as evidence of conformity per registration file # 2046A. This site is also listed with the FCC under Registration Number CA2046.

The floor, walls and ceiling consist of annealed steel panels. The walls and ceiling are covered with ferrite tile, augmented by RF absorbant foam material on the end wall nearest the turntable, and on the adjacent walls and the ceiling. The chamber floor supports a 15 cm high internal floor, constructed of annealed steel panels, that forms the ground plane, and is bonded to the chamber walls.

The 3-m diameter turntable is flush-mounted with the floor. A sub-floor cable-way is provided to route cables between the turntable pit and EUT support equipment located in the Control Room. Cables reach the EUT through an opening in the centre of the turntable.

Test instrumentation and EUT support equipment is located in the Control Room, consisting of two shielded vestibules joined together at the side of the main room. Cables are routed through bulkhead panels between the rooms and the test chamber as required. Power feeds are routed into the main room and vestibules through line filters providing at least 100 dB of attenuation between 10 kHz and 10 GHz.

Either floor mounted or table-top equipment can be tested at this facility.

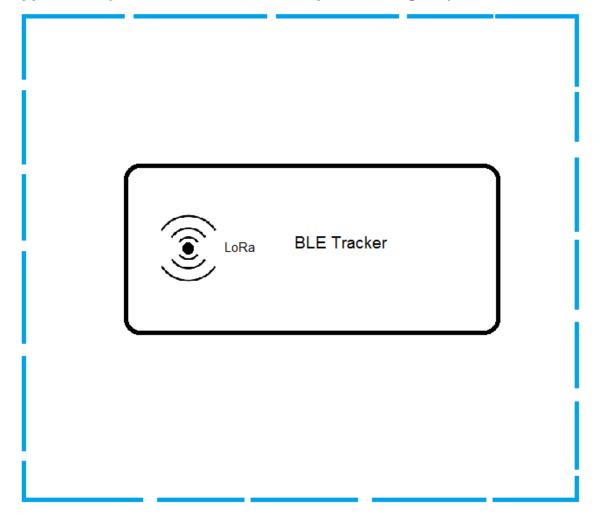

#### 3.2 Grounding Plan

The BLE TRACKER was placed at the center of the test chamber turntable on top of polystyrene foam table. No provision is made within the BLE TRACKER for an earth ground connection.

#### 3.3 Power Supply

All EUT power was supplied by a DC power supply (3.6 V).
