Mobile station coupling loss (MSCL): the minimum coupling loss (in dB) between the wireless device and the input (server) port of the consumer booster. MSCL must be calculated or measured for each band of operation and provided in compliance test reports. MSCL includes the path loss from the wireless device, and the booster's server antenna gain and cable loss. The wireless device is assumed to be an isotropic (0 dBi) antenna reference. Minimum standoff distances from inside wireless devices to the booster's server antenna must be reasonable and specified by the manufacturer in customer provided installation manuals.

L p = 20logf + 20logd - 27.5Where: L P = basic free space path loss, f = Center frequency (MHz), d = 2 meters. MSCL for 698-716MHz Lp=20log(707)+20log(2)-27.5=35.51RSSI=Downlink output power - Downlink gain

	50.60	Н	-50.90		
	104.80	Н	-52.35		
	Uplink / 707MHz				
4	Frequency	Spurious	Emission	Limit (dBm)	Result
	(MHz)	Polarization	Level (dBm)		
	42.40	Vertical	-49.62	-13.00	PASS
	45.60	V	-53.42		
	50.80	V	-45.90		
	43.40	Horizontal	-47.06		
	50.60	Н	-53.19		

**Note:** Test Frequency range is up to 10GHz, and the test data below 30MHz and above 1000MHz is too lower than the limit, so not show in this report.
