## RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by: [(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] • [ $\sqrt{f(GHz)}$ ]  $\leq$  3.0 for 1-g SAR and  $\leq$  7.5 for 10-g extremity SAR, where

 $\ensuremath{\text{f}}\xspace(\ensuremath{\text{GHz}}\xspace)$  is the RF channel transmit frequency in GHz Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

```
eirp = pt x gt = (EXd)^2/30 where:

pt = transmitter output power in watts,

gt = numeric gain of the transmitting antenna (unitless),

E = electric field strength in V/m, --- 10^{((dBuV/m)/20)}/10^6

d = measurement distance in meters (m)---3m

Sopt = (EXd)^2/30 x gt

Ant gain=0dBi ; so Ant numeric gain=1

Field strength =70.98dBuV/m @3m

So Pt={ [10^{(70.98/20)}/10^6 x3]^2/30x1}x1000 mW =0.0038mW

So (0.0038mW/5mm)x \sqrt{0.43391} GHz = 0.0005 < 3
```

Then SAR evaluation is not required
