

Feature description :

1. Manual control : Turn the switch knob to different positions, the MCU will output different control signals to the driver circuit, to drive different light color and features.

2. Remote control : When antenna receive ASK radio signals of 433.92MHz, through SYN480R RF receiver IC, reform and enlarge to output a square wave signal to MCU to decode, MCU will give instructions according to different signals to the driver circuit, to drive different light color and features.

The receiver type is super heterodyne receiver.
