4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

☒ Continuous Transmitting Fixed Channel Frequency Mode (Hopping OFF) with Modulated Carrier

- Maximum Power: MAX PWR 7
- Test Channels: Bottom | Middle | Top
- BT-Mode & Packet Type : As required
 - BT-BR Mode : (DH5)
 - BT-EDR Mode : (2DH5) or (3DH5)

☒ Continuous Transmitting Hopping Channels Frequency Mode (Hopping ON) with Modulated Carrier

- Maximum Power: MAX PWR 7
- Test Channels: Hopping ON
- BT-Mode & Packet Type : As required
 - BT-BR Mode : (DH5)
 - BT-EDR Mode : (2DH5) or (3DH5)

Note 1 : For all testing (with the exception of Radiated Band Edge Emissions) the worst case modulation scheme was used. This was taken from test report, serial number RF161216E08-3, for pre-certified radio module FCC ID: UAY-W8997-M1216

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- The applicant or manufacturer supplied test setup instructions "SYS-C31-DMV___Test_Radio_guidance_00" issued on 22 April 2022 was used to configure the EUT.

EUT Power Supply:

- The EUT was powered with 12V DC via an external AC/DC power supply

Test Mode Activation:

- The EUT can be connected with the Test laptop via USB-UART cables supplied by the customer. The cable was used only for configuration and was removed during the measurement.
- The test modes were activated by the terminal software "Tera Term". The commands to setup the respective modes and power were defined by the customer in the setup instructions.

AC Conducted Emissions Measurements:

- The EUT RF sample with antenna was used for AC conducted emissions measurements.
- The measurements were carried out with 120 VAC/60Hz & 240 VAC/60Hz.
- The Toyo EMI Software EP5/CE Ver 4.0.1. was used for these measurements.

Radiated Measurements:

- The EUT RF sample with antenna was used for radiated spurious emissions measurements.
- As per the applicant's declaration &/operational description of the EUT, the EUT is a tabletop equipment for its intended application. Therefore, EUT's test setup placement was performed in accordance with ANSI C63.10 section 6.2.3.2 & section 6.12 Figure 4.
- The EUT with its integrated antenna was evaluated for its worst-case position w.r.t to maximum radiated power measured and it was found that EUT in Standing position is the worst-case. Therefore, this report includes relevant results.
- The position of the Antenna was 90° vertical in the z-axis from the EUT.
- Radiated measurements below 30 MHz were performed with the EUT positioned on the turn table and rotating 360 degrees while the loop antenna height was set at 100 cm.
- Radiated measurements above 30 MHz were performed with the EUT positioned on the turn table and rotating 360° while the antenna height varies from 1 to 4 m over the measurement frequency range.
- R&S® EMC32 V11.30 Software was used for the Radiated spurious emission measurements.

Duty Cycle Correction Details:

- As the continuous transmission of the EUT ($D \geq 98\%$) cannot be achieved and EUT was transmitting continuously at a worst-case Duty Cycles of 84.40%(duty cycle variations are less than $\pm 2\%$ at the respective data rate). Therefore, Duty Cycle Correction Factor of 0.74 dB was added to all average measurements, to compute the corrected average values of the emissions that would have been measured had the test been performed at 100% Duty Cycle.

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to Section 6 *Measurement Uncertainty* for details.

In accordance with DAkkS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

- The measurement was performed with following worst-case mode.
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping OFF | Bottom channel | MAX PWR 7
- Pre-scans were performed, and markers placed on the highest live and neutral measured levels. Final measurements were performed on the marker frequencies and the results entered into the tables below.
- The final measured value, for the given emission, in the table below incorporates the cable loss.
- All other emissions shown on the pre-scan plot were investigated. Only the highest 6 emissions have been reported in the tables below in accordance with ANSI C63.10 section 6.2.5.
- Measurements were performed in shielded room (SR7/ 8 Asset Number 1603671). The EUT was placed at a height of 80 cm above the reference ground plane and in a distance of 40 cm from the vertical ground plane at the edge of the table.

5.2.2. Transmitter Duty Cycle**Test Summary:**

Test Engineer:	Muhammad Faiq Khan	Test Date:	12 May 2022
Test Sample Serial Number:	220405435 (RF Test Sample)		
Test Site Identification	SR 1/2		

FCC Reference:	Part 15.35(c)
Test Method Used:	FCC KDB 558074 Section 9.b) referencing ANSI C63.10 Section 7.5

Environmental Conditions:

Temperature (°C):	24.2
Relative Humidity (%):	41.4

Note:

- The transmitter duty cycle was measured using a spectrum analyser in the time domain and calculated by using the following calculation:

$$\text{Duty Cycle (\%)} = 100 \times [\text{On Time } (T_{ON})] / [\text{Period}(T_{ON} + T_{OFF}) \text{ or } 100\text{ms whichever is the lesser}]$$

$$\text{Duty Cycle Correction Factor} = 10 \log 1 / [\text{On Time } (T_{ON})] / [\text{Period}(T_{ON} + T_{OFF}) \text{ or } 100\text{ms whichever is the lesser}]$$

Test Setup:

Transmitter Duty Cycle (continued)**Results: BT-BR Mode / Packet Type: DH5 / Hopping OFF/ Bottom Channel / MAX PWR 7**

0.81247	0.96255	84.40	0.74

**Note:**

The correction factor of 0.74 dB was used to compute the Average values for all data rates since it is the worst-case duty cycle measured.

Test Sample Serial Number:	220405435 (RF Test Sample)		
Test Site Identification	SR 1/2		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	ANSI C63.10:2013 Sections 6.3 and 6.4
Frequency Range	9 kHz to 30 MHz

Environmental Conditions:

Temperature (°C):	25.1
Relative Humidity (%):	46.9

Notes:

- In accordance with FCC KDB 414788 D01 Radiated Test Site & ANSI C63.10 clause 5.2 an alternative test site that can demonstrate equivalence to a open area test site may be used. Therefore, the measurement was performed in a Semi Anechoic Chamber. (The OATS / SAC comparison data is available upon request).
- The limits are specified at a test distances of 30 and 300 metres. However, as specified in FCC Section 15.31 (f)(2) & ANSI C63.10 clause 6.4.3, measurements may be performed at a closer distance and the measured level extrapolated to the specified measurement distance using the method described in clauses 6.4.4, specifically sub-clause 6.4.4.1 which specifies that the measured level shall be extrapolated to the specified distance by conservatively presuming that the field strength decays at 40 dB/decade.
Therefore, measurements were performed at a measurement distance of 3 m.
- Therefore, the limit values are extrapolated to a measurement distance of 3 m.
 - 9 kHz- 490 kHz: limits extrapolated from 300 m to 3 m by adding 80 dB at 40 dB /decade.
 - 490 kHz-1705 kHz: limits extrapolated from 30 m to 3 m by adding 40 dB at 40 dB /decade.
- Measurements below 30 MHz were performed in a semi-anechoic chamber SR1/ 2 (Asset Number 1603665) at a distance of 3 m. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. The measurement loop antenna height was 100 cm.
- The radiated emissions measurements were performed with the EUT set to the following worst-case mode.
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping OFF | Bottom channel | MAX PWR 7
- The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
- All other emissions shown on the pre-scan plot were investigated and found to be below the measurement system noise floor.
- Pre-scans were performed, and markers placed on the highest measured levels. The test receiver was set to:
 - Frequency range: 9 kHz-150 kHz: RBW: 1 kHz /VBW: 3 kHz
 - Frequency range: 150 kHz – 30 MHz: RBW: 10 kHz /VBW: 30 kHz
 - Detector: Max-Peak detector
 - Trace Mode: Max Hold

Test Engineer:	Muhammad Faiq Khan	Test Date:	09 May 2022
Test Sample Serial Number:	220405435 (RF Test Sample)		
Test Site Identification	SR 1/2		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	ANSI C63.10:2013 Sections 6.3 and 6.5
Frequency Range	1 GHz to 26.5 GHz

Environmental Conditions:

Temperature (°C):	24.3
Relative Humidity (%):	41.9

Note(s):

- Pre-scans above 1 GHz were performed in a semi-anechoic chamber SR1/ 2 (Asset Number 1603665) with RF absorbers on the floor at a distance of 3 m. The EUT was placed at a height of 1.5 m above the test chamber floor in the centre of the chamber turntable. All measurement antennas were placed at a fixed height of 1.5 m above the test chamber floor, in line with the EUT. Final measurements above 1 GHz were performed in a semi-anechoic chamber SR1/ 2 (Asset Number 1603665) with absorber on the floor at a distance of 3 m. The EUT was placed at a height of 1.5 m above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 m to 4 m.
- The emissions shown at frequencies approximately 2.4 GHz to 2.4835 GHz on the 1 GHz to 18 GHz plots are the EUT fundamental for the tested channels.
- Pre-scans were performed, and a marker placed on the highest measured level of the appropriate plot. The test receiver resolution bandwidth was set to 1 MHz and video bandwidth 3 MHz. The sweep time was set to auto.
- The radiated emissions measurements from 1 GHz to 18 GHz were performed with the following worst-case mode.
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping OFF | Bottom/Middle/Top | MAX PWR 7
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping ON | MAX PWR 7
- The radiated emissions measurements above 18 GHz were performed with Hopping off and EUT set to bottom channel with the following worst-case mode.
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping OFF | MAX PWR 7
- For frequency range 1 GHz to 18 GHz, all emissions shown on the pre-scan plots were investigated and found to be below system noise floor.
- In accordance with ANSI C63.10-2013 Section 5.3.3 & 6.5.3 measurements above 18 GHz were performed at closer distance (1 m); because at specified measurement distance (3m) for compliance the instrumentation noise floor was typically close to the radiated emission limit.

For frequency range between 18 GHz and 26.5 GHz, no critical emissions were found. All emissions shown on the pre-scans were investigated and found to be below the noise floor of the measurement system.

5.2.4. Transmitter Band Edge Radiated Emissions**Test Summary:**

Test Engineer:	Muhammad Faiq Khan	Test Date:	05 May 2022 & 09 May 2022
Test Sample Serial Number:	220405435 (RF Test Sample)		
Test Site Identification	SR 1/2		

FCC Reference:	Parts 15.247(d), 15.209(a) & 15.205(a)
Test Method Used:	FCC KDB 558074 Section 9
	ANSI C63.10:2013 Section 7.8.6 referencing Section 6.10
	Emissions in Authorized-band / non-restricted frequency bands: ANSI C63.10:2013 Section 6.10.4
	Emissions in restricted frequency bands: ANSI C63.10:2013 Section 6.10.5

Environmental Conditions:

Temperature (°C):	22.9 to 25.1
Relative Humidity (%):	39.8 to 45.4

Note(s):

1. The measurements were in a semi-anechoic chamber SR1/ 2 (Asset Number 1603665) with RF absorbers on the floor at a distance of 3 m. The EUT was placed at a height of 1.5 m above the test chamber floor in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 m to 4 m
2. As the lower band edge falls within a non-restricted band, measurements were performed in accordance with ANSI C63.10:2013 Section 6.10.4. As the maximum peak conducted output power was previously measured, in accordance with FCC Part 15.247(d) lower band edge measurement was performed with a peak detector and the -20 dBc limit applied.
3. As the lower band edge falls within a non-restricted band, only peak measurements are required. The test receiver resolution bandwidth was set to 100 kHz and video bandwidth 300 kHz. A peak detector was used, sweep time was set to auto and trace mode was Max Hold. The test receiver was left to sweep for a sufficient length of time in order to maximise the carrier level and out-of-band emissions. A marker and corresponding reference level line were placed on the peak of the carrier. Marker frequencies and levels were recorded.
4. The restricted band peak measurements were performed in accordance with ANSI C63.10:2013 Section 6.10.5
5. As the upper band edge falls within a restricted band both peak and average measurements were recorded by placing a marker at the edge of the band. For peak measurements the test receiver resolution bandwidth was set to 1 MHz and the video bandwidth 3 MHz A peak detector was used, sweep time was set to auto and trace mode was Max Hold. For average measurements the test receiver resolution bandwidth was set to 1 MHz and the video bandwidth 3 MHz and Average detector was used, the trace mode was Max hold. A marker was placed on the band edge spot frequencies and a second marker placed on the highest emission level in the adjacent restricted band of operation (where a higher-level emission was present). Marker frequencies and levels were recorded.
6. There is a restricted band 10 MHz below the lower band edge. The test receiver was set up as follows: the RBW set to 1 MHz, the VBW set to 3 MHz, with the sweep time set to auto couple. Peak and average measurements were performed with their respective detectors. Markers were placed on the highest point on each trace.

Transmitter Band Edge Radiated Emissions (continued)**Note(s):**

7. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
8. In accordance with ANSI C63.10 Section 6.10.4 the measurements were performed twice :
 - once with the Fixed Channel Frequency Mode (Hopping OFF)
 - repeated with Hopping Channels Frequency Mode (Hopping ON)
9. The final radiated emissions measurements were performed with the EUT set to the following worst-case mode with highest output power and on the mode with the widest bandwidth.
 - BT-BR Mode | Packet Type: DH5 | Hopping OFF | MAX PWR 7
 - BT-BR Mode | Packet Type: DH5 | Hopping ON | MAX PWR 7
 - BT-EDR Mode | Packet Type: 2DH5 | Hopping OFF | MAX PWR 7
 - BT-EDR Mode | Packet Type: 2DH5 | Hopping ON | MAX PWR 7
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping OFF | MAX PWR 7
 - BT-EDR Mode | Packet Type: 3DH5 | Hopping ON | MAX PWR 7
10. As the continuous transmission of the EUT ($D \geq 98\%$) cannot be achieved and EUT was transmitting continuously at worst-case Duty Cycles of 84.40%(duty cycle variations are less than $\pm 2\%$ at the respective data rate). Therefore, Duty Cycle Correction Factor of 0.74 dB was added to all average measurements, to compute the corrected average values of the emissions that would have been measured had the test been performed at 100% Duty Cycle.

6. Measurement Uncertainty

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

Measurement Type	Confidence Level (%)	Calculated Uncertainty
AC Conducted Spurious Emissions	95%	±2.49 dB
Transmitter Duty Cycle	95%	±3.4%
Radiated Spurious Emissions	95%	±3.10 dB
Band Edge Radiated Emissions	95%	±3.10 dB

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
