

Antenna orientation during surveys: 2ALZQ-RAPTOR45-TX

We do not specify the antenna orientation and/or separation between Receiver and Transmitter antennas, except for that the antenna receiving/transmitting sides must be directed towards ground.

Separation distance and polarization are dictated by the carrier solution, which in many cases are provided by the end-client, we provide some examples and suggestions, of which the one shown here is the simplest.

Example configuration, Antennas placed on wear-plate directed towards ground. Parallel mounting.

Example configuration, Antennas placed on wear-plate directed towards ground. In-line mounting.

Example configuration, ready for operation. Antennas placed on wear-plate directed towards ground, and wear plate hooked up to trolley.
