

**5 FCC §15.247(i), §1.1310, § 2.1091 - Maximum Permissible Exposure (MPE)**

**5.1 Applicable Standard**

According to subpart 15.247(i)and subpart §1.1310, systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission’s guidelines.

**Limits for Maximum Permissible Exposure (MPE) (§1.1310, §2.1091)**

| <b>(B) Limits for General Population/Uncontrolled Exposure</b> |                                      |                                      |  |                                 |
|--|--------------------------------------|--------------------------------------|--|---------------------------------|
| <b>Frequency Range (MHz)</b>                                   | <b>Electric Field Strength (V/m)</b> | <b>Magnetic Field Strength (A/m)</b> | <b>Power Density (mW/cm<sup>2</sup>)</b> | <b>Averaging Time (minutes)</b> |
| 0.3–1.34   | 614                                  | 1.63                                 | *(100)                                   | 30                              |
| 1.34–30  | 824/f                                | 2.19/f                               | *(180/f <sup>2</sup> )                   | 30                              |
| 30–300   | 27.5                                 | 0.073                                | 0.2                                      | 30                              |
| 300–1500   | /                                    | /                                    | f/1500                                   | 30                              |
| 1500–100,000   | /                                    | /                                    | 1.0                                      | 30                              |

f= frequency in MHz; \* = Plane-wave equivalent power density;

According to §1.1310 and §2.1091 RF exposure is calculated.

**Calculated Formulary:**

Predication of MPE limit at a given distance

S = PG/4πR<sup>2</sup> = power density (in appropriate units, e.g. mW/cm<sup>2</sup>);

P = power input to the antenna (in appropriate units, e.g., mW);

G = power gain of the antenna in the direction of interest relative to an isotropic radiator, the power gain factor, is normally numeric gain;

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm);

For simultaneously transmit system, the calculated power density should comply with:

$$\sum_i \frac{S_i}{S_{Limit,i}} \leq 1$$

## 5.2 RF Exposure Evaluation Result

### MPE evaluation:

| Mode      | Frequency Range (MHz) | Antenna Gain |           | Target Power |       | Evaluation Distance (cm) | Power Density (mW/cm <sup>2</sup> ) | MPE Limit (mW/cm <sup>2</sup> ) |
|-----------|-----------------------|--------------|-----------|--------------|-------|--------------------------|-------------------------------------|---------------------------------|
|           |                       | (dBi)        | (numeric) | (dBm)        | (mW)  |                          |                                     |                                 |
| WIFI 2.4G | 2437                  | 3.3          | 2.14      | 16           | 39.81 | 20                       | 0.0169                              | 1.0                             |
| Sub-1G    | 920.5-924.5           | 3            | 1.995     | -4.4         | 0.363 | 20                       | 0.0001                              | 0.613                           |

Sub-1G EIRP = 93.78 dBμV/m – 95.23 = -1.45dBm

Conducted Power = -1.45dBm -3dBi = -4.45dBm

### MPE evaluation for simultaneous transmission:

WIFI 2.4G and Sub-1G can transmit at the same time, MPE evaluation is as below formula:

$PD1/Limit1 + PD2/Limit2 + \dots < 1$ , PD (Power Density)

### MPE evaluation:

MPE of WIFI 2.4G/1 + MPE of Sub-1G/0.613

= 0.0169/1 + 0.0001/0.613 = 0.017063 < 1.0

**Result:** MPE evaluation of single and simultaneous transmission meet the requirement of standard.
