ADMINISTRATIVE INFORMATION

Test Laboratory:	EMCE Engineering 1726 Ringwood Ave. San Jose, CA 95131 USA 510-490-4307
Facility No. registered through NVLAP:	NVLAP Lab Code: 200092-0
Test Site:	FCC : US0125
Applicant Company Name :	Higher Ground LLC
Applicant Contact Name :	Rob Reis
Application Purpose :	Original
EUT Description :	Satellite Texting Device
Product Name :	SatPaq
Model Number :	SatPaq
Serial Number :	N/S
Applied Requirements :	FCC CFR Title 47 Part 25 – Satellite Communications
Measurement Distance :	3 m up to 1 GHz, 3 m above 1 GHz
Classification of EUT :	Licensed Non-Broadcast Station Transmitter (TNB)
RF Operating Frequencies :	5928 - 6170 MHz
Modulation :	DSS
Rated RF Output Power (Watts) :	1.0 [Antenna Conducted]
Type of Equipment :	Satellite Texting Device
Testing Configuration :	The EUT model name SatPaq, was setup per applicable specifications during EMI testing.
Operating Condition (Temp) :	Ambient
Supply Power to EUT : (If Battery supply details)	Lithium-Ion (Li-Ion): Ascent Batteries, ABI-H235471, 3.15 Wh, +850 mAh, 3.7 V
Supply Voltage :	3.7V DC
Receipt of EUT :	6-10-2017
Date of Testing :	6-16-2017 - 6-26-2017
Tested By :	Bob Cole
Approved By (CTO) :	Bob Cole
Test Report Number :	4322-2
Test Report Issue Date :	8-23-2017
Test Report Prepared By:	Amy Jones
Test Report Reviewed By:	Bob Cole

Accreditation

EMCE Engineering, has been placed on the Federal Communications Commission's list of recognized facilities for Parts 15 and 18 DoC approvals. Per the request of EMCE Engineering, the facility has been added to the list of those who perform Measurement Services for the public on a fee basis. This list is published periodically and is also available on the FCC Website. Additionally, EMCE Engineering has been accredited by the National Institute for Standards and Technology under the NVLAP program (Testing Lab Code 200092-0).

Disclaimer

EMCE Engineering, Inc., assumes no responsibility for the continuing validity of test data when the Equipment under Test is not under the continuous physical control of EMCE. The signature below attests to the fact that all measurements reported herein were performed by myself or were made under my supervision, and are correct to the best of my knowledge and belief as of the date specified. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them. Tests were conducted by qualified EMCE Engineering, Inc. personnel utilizing test equipment maintained in a "current" state of calibration with traceability to NIST.

- This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.
- This report or certificate shall not be reproduced except in full without the written approval of the issuer.

Modifications

There were no modifications installed by EMCE Engineering.

Any modifications installed previous to testing by the Manufacturer will be incorporated into each production model, sold or leased.

Statement of Compliance

We, EMCE Engineering, declare under our sole responsibility that the product tested complies with the following listed standards:

Equipment Under Test:	Satellite Texting Device
Model Number:	SatPaq
Serial Number:	N/S
Report Number:	4322-2
Test Date:	6-16-2017 - 9-7-2017
Company:	Higher Ground LLC
Street Address:	2225 E. Bayshore Rd, Suite 200 Palo Alto, California, 94303

This Statement of Compliance is based upon compliance of the product with the following FCC Rules:

FCC CFR Title 47 Part 25	Satellite Communications
--------------------------	--------------------------

Issued by Test Laboratory:

Testing Lab Code: 200092-0

EMCE Engineering

Test Location

Test Facility

All EMC Testing was performed at:

EMCE Engineering, Inc.
1726 Ringwood Ave.
San Jose, CA 95131
USA

Site Attenuation

The site attenuation for radiated measurements has been determined for this test site using the method described in ANSI C63.4 Paragraph 5.4.6 and sub paragraphs. The site attenuation is measured annually.

Input Power for EUT

Battery Powered – 3.7VDC Lithium-ion

Accessory Equipment Precautions

Care was taken that accessory equipment or adjacent equipment did not produce unacceptable interference so as to contaminate the final test data. The EMI receiver and its associated computer, printer and plotter were located greater than 15 meters away from the EUT during testing and were powered from a separately filtered power source.

Ambient Interference

3 Meter Semi-Anechoic Chamber is scanned for ambient RF interference before final RF Testing.

Personnel

All testing was performed by EMCE Engineering personnel who are properly trained for the instruments and procedures used.

Use of Interference Measurement Equipment

All of the emission measurements and field strength measurements were performed utilizing various EMC measurement equipment. The Emissions Measurement Lab utilizes the following basic instruments:

1. Toshiba Satellite Laptop Computer
2. EMI Test v4.1 measurement software
3. Rohde & Schwarz FSV40 Spectrum Analyzer
4. HP 8477F Pre Amp
5. HP 8449B Pre Amp
6. Sunol Sciences JB-6 Hybrid Antenna
7. EMCO 3110 Horn Antenna

FCC ID:	2AMUHSP001
APPLICANT:	HIGHER GROUND LLC

Test results are recorded on tabular data sheets and show final corrected values compared to the specification limit. Sample calculations show how the antenna factors, cable losses, amplifier gain, etc. are combined in the automatic analyzer program to produce the final corrected values shown on the graphs and data sheets.

Calibration of Measuring Equipment

The EMI Receiver (spectrum analyzer) is calibrated by an ISO 17025 Accredited calibration laboratory on an annual basis. The laboratory provides certification accredited to ISO 17025. Antenna factors are measured on an annual basis by an ISO 17025 Accredited Antenna Calibration Facility. Cable losses as well as amplifier gains are swept at least every month to verify accurate values.

<i>Total Measurement Uncertainty - Radiated Emissions @ 10 Meters</i>					5.87

Sample Calculations

Conducted Spurious Emissions

Measurements are compared directly to the applicable limits. The calculation is as follows:

Where:

$$R_r - S = M$$

R_r = Measured value in dBm
 S = Specification Limit
 M = Margin

Radiated Spurious Emissions

Receiver readings are compared directly to a converted specification limit (dB form), the conversion uses the effective radiated power limit specified in the standard to calculate the expected field strength in free space using the following formula:

Where:

$$E = \sqrt{30 * P * G} / d$$

E = Field Strength in V/M
 P = Power in Watts
 G = Gain of antenna in dB
 D = Distance in meters

The field strength limit is then converted to decibel form (dBuV/M) and the margin of a given peak is calculated as follows:

Where:

$$M = R_c - L_s$$

M = Margin
 R_c = Corrected Reading in dBuV/M
 L_s = Calculated Specification Limit in dBuV/M

When substitution measurements are required (all signals with <6 dB margin relative to the Specification limit) the margin of the emission relative to the effective radiated power is calculated as follows:

Where:

$$P_s - S = M$$

P_s = ERP determined from antenna substitution (dBm)
 S = Specification limit in dBm
 M = Margin

Date: 26 JUN 2017 12:29:32

2. RF Output Power Measurement

Test Limit

In bands shared coequally with terrestrial radio communication services, the equivalent isotropically radiated power transmitted in any direction towards the horizon by an earth station, other than an ESV, operating in frequency bands between 1 and 15 GHz, shall not exceed the following limits except as provided for in paragraph (c) of this section: + 40 dBW in any 4 kHz band for $\theta \leq 0^\circ$ + 40 + 3 θ dBW in any 4 kHz band for $0^\circ < \theta \leq 5^\circ$ Where θ is the angle of elevation of the horizon viewed from the center of radiation of the antenna of the earth station and measured in degrees as positive above the horizontal plane and negative below it.

Test Results

Modulation Mode	Power Meter Level Average Power (dBm)	Antenna Gain - matching loss (dBi)	E.I.R.P Measured (dBm)	E.I.R.P Limit (dBm)	Tolerance	Result
DSS	30.0	7.75	37.75	39	+/- 1.25	PASS

Note: E.I.R.P (dBm) = Average Power (dBm) + Antenna Gain (dBi). FCC 47 CFR Part25, Limit Clause 25.204 +40 dBW in any 4 kHz band for $\theta \leq 0^\circ$ +40 + 3 θ dBW in any 4 kHz band for $0^\circ < \theta \leq 5^\circ$ For angles of elevation of the horizon greater than 5° there shall be no restriction as to the equivalent isotropically radiated power transmitted by an earth station towards the horizon.

3. Unwanted Emission at Antenna Terminal Measurement

Test Limit

FCC Part 25.202(f) Emissions Limitations The mean power of the emissions shall be attenuated below the mean output power of the transmitter in accordance with the following schedule: (1) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 50% up to and including 100% of the authorized bandwidth: 25 decibels; (2) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 100% up to and including 250% of the authorized bandwidth: 35 decibels; (3) In any 4 kHz band, the center frequency of which is removed from the assigned frequency by more than 250% of the authorized bandwidth: an amount equal to 43 decibels plus 10 times Logarithm (to the base 10) of the transmitter power in watts

Note 1: The Resolution Bandwidth (RBW) was corrected from 4 kHz by $10\log_{10} [(used\ RBW) / 4kHz] = 10\log_{10} (3kHz / 4kHz) = -1.25$; Note 2: Emission limits are computed based on following: 1. Emissions Limits (dBm) (50% -100% of Bandwidth) = $P - 25 + CF = -6.67dBm$; 2. Emissions Limits (dBm) (100% - 250% of Bandwidth) = $P - 35 + CF = -16.67dBm$; 3. Emissions Limits (dBm) (> 250% of Bandwidth) = $P - [43 + 10 \log_{10} PW] + 30 + CF = -14.25dBm$; Where P = Measured mean power in dBm = 19.58 dBm PW = Measured mean power in W CF = RBW correction factor = -1.25

5928 MHz

Date: 16 JUN 2017 12:29:35

6049 MHz

6. Protection of Aeronautical Radio Navigation Satellite Service

Test Limit

FCC Part 25.216(h)(j)(f) (h) Mobile earth stations manufactured more than six months after Federal Register publication of the rule changes adopted in FCC 03-283 with assigned uplink frequencies in the 1626.5-1660.5 MHz band shall suppress the power density of emissions in the 1605-1610 MHz band-segment to an extent determined by linear interpolation from -70 dBW/MHz at 1605 MHz to -46 dBW/MHz at 1610 MHz, averaged over any 2 millisecond active transmission interval. The e.i.r.p of discrete emissions of less than 700 Hz bandwidth from such stations shall not exceed a level determined by linear interpolation from -80 dBW at 1605 MHz to -56 dBW at 1610 MHz, averaged over any 2 millisecond active transmission interval. (i) The e.i.r.p density of carrier-off state emissions from mobile earth stations manufactured more than six months after Federal Register publication of the rule changes adopted in FCC 03-283 with assigned uplink frequencies between 1 and 3 GHz shall not exceed -80 dBW/MHz in the 1559-1610 MHz band averaged over any two millisecond interval. (j) A Root-Mean-Square detector shall be used for all power density measurements. FCC Part 25.254(b)(4) Special requirements for ancillary terrestrial components operating in the 1610-1626.5 MHz / 2483.5-2500 MHz bands (b) An applicant for an ancillary terrestrial component in these bands must demonstrate that mobile terminals shall: (4) ATC mobile terminals operating in assigned frequencies in the 1610-1626.5 MHz band shall not generate EIRP density, averaged over any two-millisecond active transmission interval, greater than -70 dBW/MHz in the 1559-1605 MHz band or greater than a level determined by linear interpolation in the 1605-1610 MHz band, from -70 dBW/MHz at 1605 MHz to -10 dBW/MHz at 1610 MHz. The EIRP, averaged over any two-millisecond active transmission interval, of discrete out-of-band emissions of less than 700 Hz bandwidth from such mobile terminals shall not exceed -80 dBW in the 1559-1605 MHz band or exceed a level determined by linear interpolation in the 1605-1610 MHz band, from -80 dBW at 1605 MHz to -20 dBW at 1610 MHz. The EIRP density of carrier-off-state emissions from such mobile terminals shall not exceed -80 dBW/MHz in the 1559-1610 MHz band, averaged over a two-millisecond interval. A root-mean-square detector function with a resolution bandwidth of one megahertz or equivalent and no less video bandwidth shall be used to measure wideband EIRP density for purposes of this rule, and narrowband EIRP shall be measured with a root-mean-square detector function with a resolution bandwidth of one kilohertz or equivalent.

Test Result

N/A

CONCLUSION

*The data collected relates only to the item(s) tested, and shows that the Higher Ground LLC **SatPaq** device is in compliance with Part 25 of the FCC Rules.*

FCC ID:	2AMUHSP001
APPLICANT:	HIGHER GROUND LLC
