Maximum Permissible Exposure Report

Product Information

	24N/Z ID)/ 2440			
FCC ID:	2AN7JRV-3410			
Product name	Smart home wifi camera			
Model number	RV-3410			
Bower supply	Input : AC 100-240V, 50/60Hz			
Power supply	Output: DC 5V, 1A			
	IEEE 802.11b: DSSS(CCK,DQPSK,DBPSK)			
Modulation Type	IEEE 802.11g: OFDM(64QAM, 16QAM, QPSK, BPSK)			
	IEEE 802.11n: OFDM (64QAM, 16QAM, QPSK,BPSK)			
Antenna Type	Internal Antenna			
Antenna Gain	3 dBi (maximum)			
Hardware version	IPG35S35S45_KL_1.2			
Software version	npcupg_gm14.00.00.82(5114)			
	IEEE 802.11b:2412-2462MHz			
WLAN FCC Operation frequency	IEEE 802.11g:2412-2462MHz			
WLAN FCC Operation frequency	IEEE 802.11n HT20:2412-2462MHz			
	IEEE 802.11n HT40:2422-2452MHz			
Extreme temp. Tolerance	-20°C to +50°C			
Exposure category	General population/uncontrolled environment			
EUT Type	Production Unit			
Device Type	Mobile Device			

2. Evaluation Method

Systems operating under the provisions of FCC 47 CFR section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as mobile device whereby a distance of 0.2m normally can be maintained between the user and the device, and below RF Permissible Exposure limit shall comply with.

In accordance with KDB447498D01 for Simultaneous transmission MPE test exclusion applies when the sum of the MPE ratios for all simultaneous transmitting antennas incorporated in a host device, based on the calculated/estimated, numerically modelled or measured field strengths or power density, is ≤ 1.0. The MPE ratio of each antenna is determined at the minimum test separation distance required by the operating configurations and exposure conditions of the host device, according to the ratio of field strengths or power density to MPE limit, at the test frequency. Either the maximum peak or spatially averaged results from measurements or numerical simulations may be used to determine the MPE ratios. Spatial averaging does not apply when MPE is estimated using simple calculations based on far-field plane-wave equivalent conditions. The antenna installation and operating requirements for the host device must meet the minimum test separation distances required by all antennas, in both standalone and simultaneous transmission operations, to satisfy compliance.

4. MPE Calculation Method

Predication of MPE limit at a given distance Equation from page 18 of OET Bulletin 65, Edition 97-01

S=PG/4πR²

Where: S=power density

P=power input to antenna G=power gain of the antenna in the direction of interest relative to an isotropic radiator

R=distance to the center of radiation of the antenna

5. Antenna Information

The product can only use antennas certificated as follows provided by manufacturer;

Internal Identification	Antenna type and antenna number	Operate frequency band	Maximum antenna gain
Antenna 0	Internal Antenna	2000 MHz – 2500 MHz	3.0 dBi

8. Measurement Results

8.1 Standalone MPE

As declared by the Applicant, the EUT is a wireless device used in a fix application, at least 20 cm from any body part of the user or nearby persons; from the maximum EUT RF output power, the minimum separation distance, r = 20 cm, as well as the gain of the used antenna refer to antenna information, the RF power density can be obtained.

Remark:

1. Output power (Peak) including tune-up tolerance;

2. MPE evaluate distance is 20cm from user manual provide by manufacturer;

8.2 Simultaneous Transmission MPE

The sample only support one WLAN modular and one antenna, no need consider simultaneous transmission;

9. Conclusion

The measurement results comply with the FCC Limit per 47 CFR 2.1091 for the uncontrolled RF Exposure of mobile device.
