| FCC ID:                  | 2ANDL-BT7L   |
| Model No.:               | BT7L   |
| Reference<br>RF report # | 708881974869-00  |

According to subpart 15.247(i)and subpart §1.1307(b)(1), systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

Limits for Maximum Permissible Exposure (MPE) (§1.1310, §2.1091)

| (B) Limits for General Population/Uncontrolled Exposure |                                  |                                  |                           |                          |  |  |
|---|----------------------------------|----------------------------------|---------------------------|--------------------------|--|--|
| Frequency Range<br>(MHz)                                | Electric Field<br>Strength (V/m) | Magnetic Field<br>Strength (A/m) | Power Density<br>(mW/cm²) | Averaging Time (minutes) |  |  |
| 0.3–1.34  | 614                              | 1.63                             | *(100)                    | 30                       |  |  |
| 1.34–30   | 824/f                            | 2.19/f                           | *(180/f²)                 | 30                       |  |  |
| 30–300  | 27.5                             | 0.073                            | 0.2                       | 30                       |  |  |
| 300–1,500   | /                                | 1                                | f/1500                    | 30                       |  |  |
| 1,500–100,000   | 1                                | 1                                | 1.0                       | 30                       |  |  |

f = frequency in MHz; \* = Plane-wave equivalent power density;

According to §1.1310 and §2.1091 RF exposure is calculated.

Calculated Formulary:

Predication of MPE limit at a given distance

 $S = PG/4 \pi R^2 = power density (in appropriate units, e.g. mW/cm<sup>2</sup>);$ 

P = power input to the antenna (in appropriate units, e.g., mW);

G = power gain of the antenna in the direction of interest relative to an isotropic radiator, the power gain factor, is normally numeric gain;

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm);

Report No: 708881974869-00A

## Calculated Data:

| Maximum peak output power at antenna input terminal (dBm):                  | 9.75    |
|---|---------|
| Maximum peak output power at antenna input terminal (mW):                   | 9.44    |
| tune-up conducted power(dBm):   | 10      |
| tune-up conducted power(mW):  | 10      |
| Prediction distance (cm):   | 20      |
| Antenna Gain, typical (dBi):  | 2.5     |
| Maximum Antenna Gain (numeric):   | 1.78    |
| The worst case is power density at predication frequency at 20 cm (mW/cm²): | 0.00354 |
| MPE limit for general population exposure at prediction frequency (mW/cm²): | 1.0     |

**Note:** The tune-up conducted power (10 dBm) was declared by the manufacturer.

 $0.00354 \text{ (mW/cm}^2\text{)} < 1 \text{ (mW/cm}^2\text{)}$ 

Result: Compliant
