TÜV SÜD Certification and Testing (China) Co., Ltd. Shanghai Branch is a subcontractor to TÜV SÜD Product Service GmbH according to the principles outlined in ISO 17025.

TÜV SÜD Certification and Testing (China) Co., Ltd. Shanghai Branch reports apply only to the specific samples tested under stated test conditions. Construction of the actual test samples has been documented. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. The manufacturer/importer is responsible to the Competent Authorities in Europe for any modifications made to the production units which result in non-compliance to the relevant regulations. TÜV SÜD Certification and Testing (China) Co., Ltd. Shanghai Branch shall have no listly for any deductions, inferences or generalizations drawn by the client or others from TÜV SÜD Certification and Testing (China) Co., Ltd. Shanghai Branch issued reports

This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval.

## 3 Description of the Equipment under Test

### **Description of the Equipment Under Test**

Product: Zigbee Module

Model no.: ZS4S-IPEX

FCC ID: 2ANDL-ZS4S-IPEX

Options and accessories: NA

Rating: DC 2.4-3.8V

RF Transmission Frequency: 2405~2480MHz

No. of Operated Channel: 16

Modulation: O-QPSK

Channel list:

| Operation Frequency each of channel |          |    |          |  |  |
|-------------------------------------|----------|----|----------|--|--|
| Channel Frequency Channel Frequence |          |    |          |  |  |
| 11                                  | 2405 MHz | 19 | 2445 MHz |  |  |
| 12                                  | 2410 MHz | 20 | 2450 MHz |  |  |
| 13                                  | 2415 MHz | 21 | 2455 MHz |  |  |
| 14                                  | 2420 MHz | 22 | 2460 MHz |  |  |
| 15                                  | 2425 MHz | 23 | 2465 MHz |  |  |
| 16                                  | 2430 MHz | 24 | 2470 MHz |  |  |
| 17                                  | 2435 MHz | 25 | 2475 MHz |  |  |
| 18                                  | 2440 MHz | 26 | 2480 MHz |  |  |

Antenna Type: FPC Antenna

Antenna Gain: 3.3 dBi

Description of the EUT: The Equipment Under Test (EUT) is a Zigbee Module.

We tested it and listed the worst data in this report.

Test sample no.: SHA-587576-1

The sample's mentioned in this report is/are submitted/ supplied/ manufactured by client. The laboratory therefore assumes no responsibility for accuracy of information on the brand name, model number, origin of manufacture, consignment, antenna gain or any information supplied.

China

## 4 Summary of Test Standards

| Test Standards  |  |  |  |
|---|--|--|--|
| FCC Part 15 Subpart C PART 15 - RADIO FREQUENCY DEVICES |  |  |  |
| 10-1-2020 Edition Subpart C - Intentional Radiators     |  |  |  |

All the test methods were according to KDB 558074 D01 15.247 Meas Guidance v05r02 and ANSI C63.10 (2013).

# 5 Summary of Test Results

| Technical Requirements |  |            |        |      |         |     |
|------------------------|--|------------|--------|------|---------|-----|
| FCC Part 15 Subpart C  |  |            | ,      |      |         |     |

| §15.247 (b) (3)        | Conducted peak output power                    | 15-16      | Site 1 |      |         |     |
| §15.247(a)(1)          | 20dB bandwidth                                 |            |        |      |         |     |
| §15.247(a)(1)          | Carrier frequency separation                   |            |        |      |         |     |
| §15.247(a)(1)(iii)     | Number of hopping frequencies                  |            |        |      |         |     |
| §15.247(a)(1)(iii)     | Dwell Time                                     |            |        |      |         |     |
| §15.247(a)(2)          | 6dB bandwidth and<br>99% Occupied<br>Bandwidth | 17-18      | Site 1 |      |         |     |
| §15.247(e)             | Power spectral density                         | 19-20      | Site 1 |      |         |     |
| §15.247(d)             | Spurious RF conducted emissions                | 21-24      | Site 1 |      |         |     |
| §15.247(d)             | Band edge                                      | 25-26      | Site 1 |      |         |     |
| §15.247(d) & §15.209   | Spurious radiated emissions for transmitter    | 27-31      | Site 1 |      |         |     |
| §15.203                | Antenna requirement                            | See note 1 |        |      |         |     |

Remark 1: N/A - Not Applicable.

Note 1: The EUT uses an FPC Antenna, which gain is 3.3dBi. In accordance to §15.203, It is considered sufficiently to comply with the provisions of this section.

### 6 General Remarks

#### **Remarks**

This submittal(s) (test report) is intended for FCC ID: 2ANDL-ZS4S-IPEX, complies with Section 15.207, 15.209, 15.247 of the FCC Part 15, Subpart C Rules.

### **SUMMARY:**

All tests according to the regulations cited on page 5 were

- n Performed
- o Not Performed

The Equipment under Test

- n Fulfills the general approval requirements.
- O **Does not** fulfill the general approval requirements.

Sample Received Date: July 21, 2021

Testing Start Date: July 23, 2021

Testing End Date: July 27, 2021

## 7 Test Setups

## 7.1 AC Power Line Conducted Emission test setups

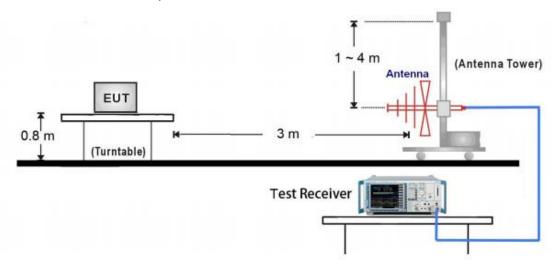

### 7.2 Radiated test setups

9kHz ~ 30MHz Test Setup:

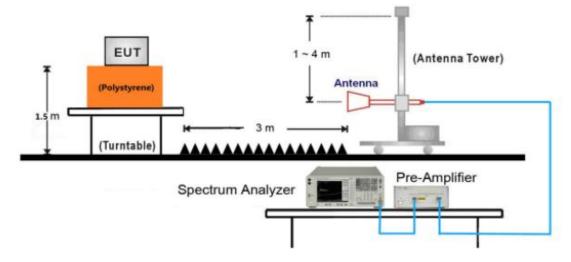

### 30MHz ~ 1GHz Test Setup:

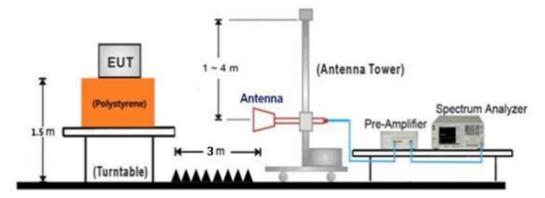

### 1GHz ~ 18GHz Test Setup:

## 18GHz ~ 25GHz Test Setup:

### 7.3 Conducted RF test setups

## 8 Systems test configuration

Auxiliary Equipment Used during Test:

| DESCRIPTION | MANUFACTURER | MODEL NO.(SHIELD) | S/N(LENGTH) |
|-------------|--------------|-------------------|-------------|
| Notebook    | Lenove       | X240              | Notebook    |

Test software: EMI\_Test\_Tool

The system was configured to channel 11, 18, and 26 for the test.

Non-hopping mode: The system was configured to operate at a signal channel transmitting. The test software allows the configuration and operation at the worst-case duty and the highest transmit power.

## 9 Technical Requirement

### 9.1 Conducted Emission

#### **Test Method**

- 1. The EUT was placed on a table, which is 0.8m above ground plane
- 2. The power line of the EUT is connected to the AC mains through a Artificial Mains Network (A.M.N.).
- 3. Maximum procedure was performed to ensure EUT compliance
- 4. A EMI test receiver is used to test the emissions from both sides of AC line

#### Limit

According to §15.207, conducted emissions limit as below:

| QP Limit | AV Limit                    |   |
|----------|-----------------------------|---|
| dΒμV     | dΒμV                        |   |
| 66-56*   | 56-46*                      |   |
| 56       | 46                          |   |
| 60       | 50                          |   |
|          | <b>dBμV</b><br>66-56*<br>56 | dBμV     dBμV       66-56*     56-46*       56     46 |

Decreasing linearly with logarithm of the frequency

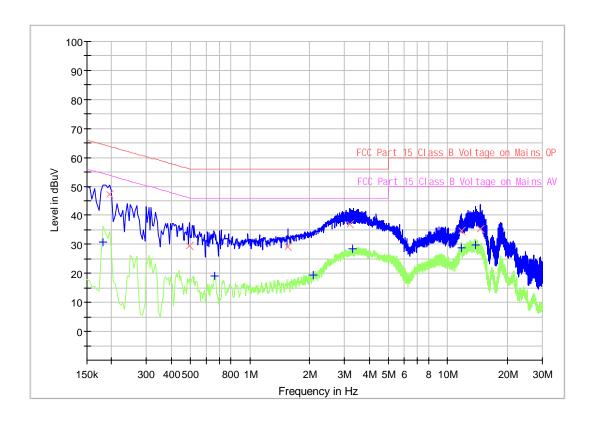

Product Type : Zigbee Module M/N : ZS4S-IPEX

Operating Condition : Mode 1: Tx\_2405MHz (worst case)

Test Specification : L-line

Comment : AC 120V/60Hz (powered by notebook)

Note 1: Measure Level (dBuV/m) = Reading Level (dBuV) + Factor (dB) Factor (dB) = Cable Loss (dB) + LISN Factor (dB) + 10dB Attenuator

### 9.2 Conducted peak output power

#### **Test Method**

- Use the following spectrum analyzer settings:
   RBW > the 6 dB bandwidth of the emission being measured, VBW≥3RBW, Span≥3RBW
   Sweep = auto, Detector function = peak, Trace = max hold.
- 2. Add a correction factor to the display.
- 3. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the peak output power.

#### Limits

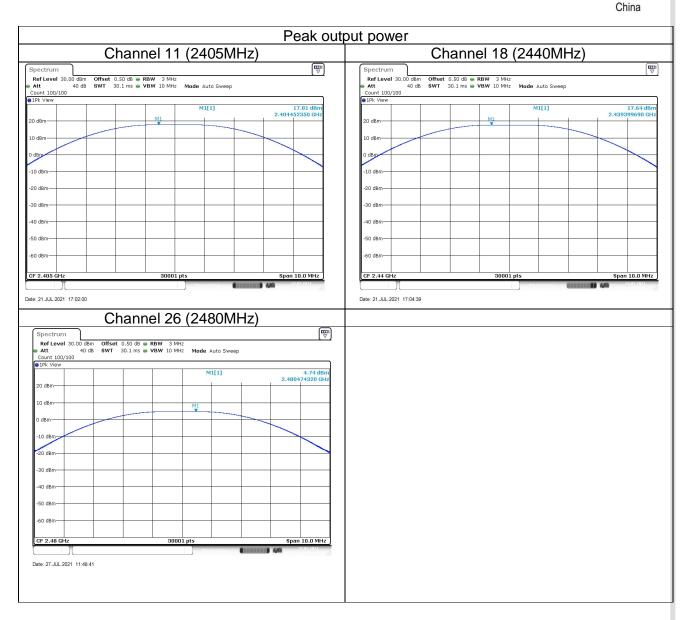

According to §15.247 (b) (3), conducted peak output power limit as below:

| Frequency Range | Limit         | Limit |
|-----------------|---------------|-------|
| MHz             | W             | dBm   |
| 2400-2483.5     | ≤1            | ≤30   |
| Frequency Range | Limit (EIRP)  | Limit |
| MHz             | W             | dBm   |
| 2400-2483.5     | <b>&lt;</b> 4 | ≤36   |

Test result as below table

| Frequency              | Conducted Peak Output Power | Result |
|------------------------|-----------------------------|--------|
| MHz                    | dBm                         |        |
| Low channel 2405MHz    | 17.81                       | Pass   |

| High channel 2480MHz   | 4.74                        | Pass   |

### 9.3 6dB bandwidth

#### **Test Method**

- Use the following spectrum analyzer settings:
   RBW=100K, VBW≥3RBW, Sweep = auto, Detector function = peak, Trace = max hold
- 2. Use the automatic bandwidth measurement capability of an instrument, may be employed using the X dB bandwidth mode with X set to 6 dB, care shall be taken so that the bandwidth measurement is not influenced by any intermediate power nulls in the fundamental emission that might be ≥ 6 dB.
- 3. Allow the trace to stabilize, record the X dB Bandwidth value.

## 9.4 Power spectral density

#### **Test Method**

This procedure shall be used if maximum peak conducted output power was used to demonstrate compliance:

- Set analyzer center frequency to DTS channel center frequency. RBW=3kHz,VBW≥3RBW,Span=1.5 times DTS bandwidth, Detector=Peak, Sweep=auto, Trace= max hold.
- 2. Allow trace to fully stabilize, use the peak marker function to determine the maximum amplitude level within the RBW.
- 3. Repeat above procedures until other frequencies measured were completed.

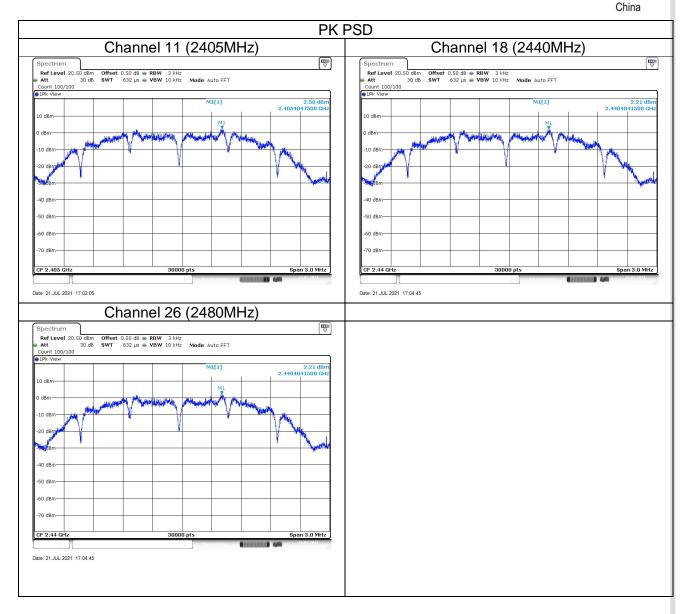

#### Limit

| Limit [dBm/3kHz] |   |
|------------------|---|
| ≤8               | _ |

## 9.5 Spurious RF conducted emissions

#### **Test Method**

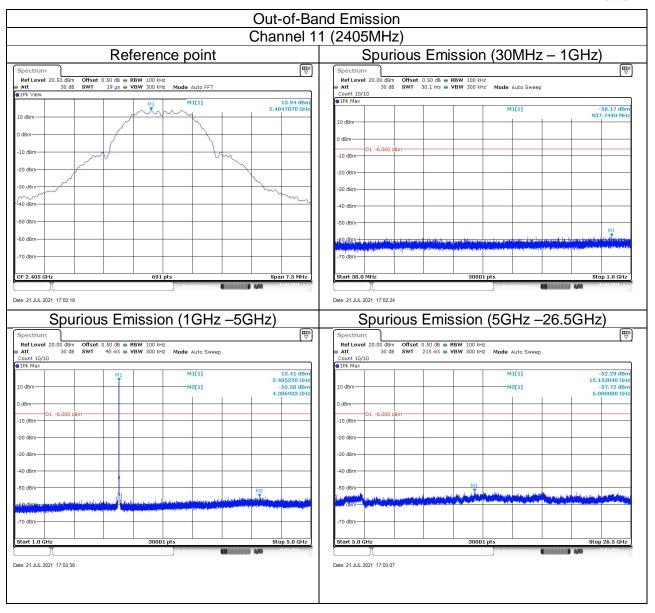

- 1. Establish a reference level by using the following procedure:
  - a. Set RBW=100 kHz. VBW≥3RBW. Detector =peak, Sweep time = auto couple, Trace mode = max hold.
  - b. Allow trace to fully stabilize, use the peak marker function to determine the maximum PSD level.
- 2. Use the maximum PSD level to establish the reference level.
  - a. Set the center frequency and span to encompass frequency range to be measured.
  - b. Use the peak marker function to determine the maximum amplitude level. Ensure that the amplitude of all unwanted emissions outside of the authorized frequency band (excluding restricted frequency bands) are attenuated by at least the minimum requirements, report the three highest emissions relative to the limit.
- 3. Repeat above procedures until other frequencies measured were completed.

#### Limit

| Frequency Range<br>MHz | Limit (dBc) |
|------------------------|-------------|
| 30-25000               | -20         |

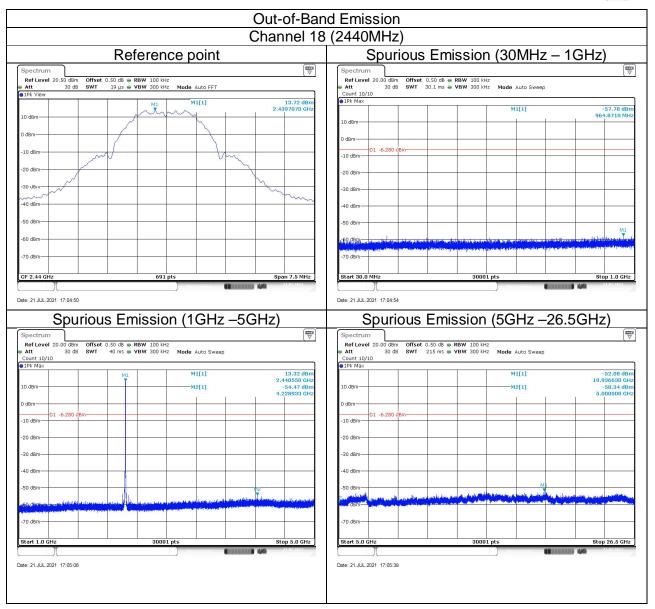

China

Note: The emission which exceed the limit is the fundamental.

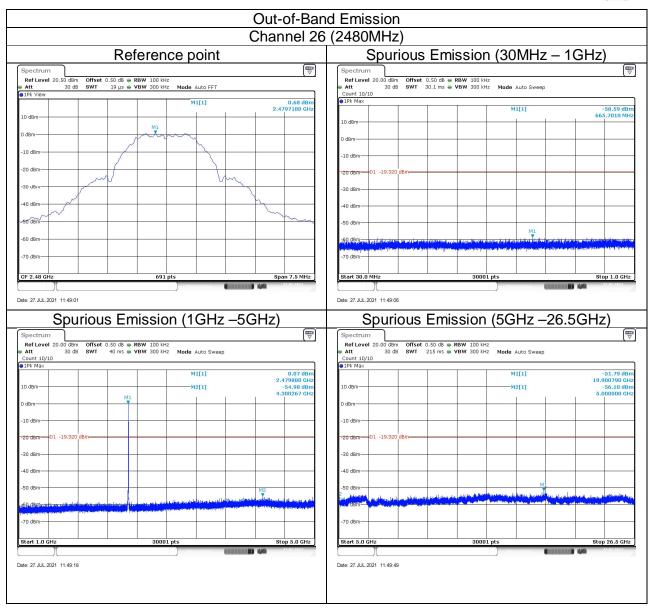

China

Note: The emission which exceed the limit is the fundamental.

China

Note: The emission which exceed the limit is the fundamental.

## 9.6 Band edge

#### **Test Method**

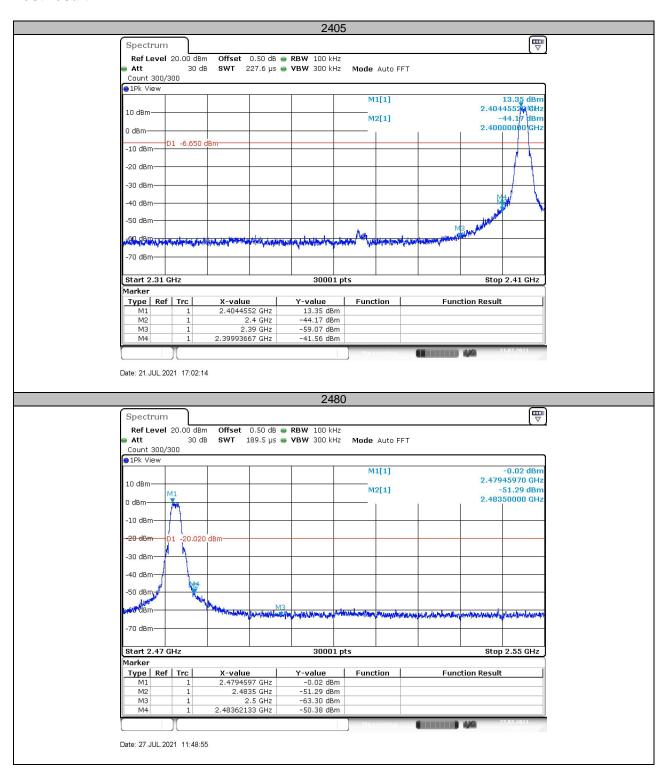

- 1 Use the following spectrum analyzer settings: Span = wide enough to capture the peak level of the in-band emission and all spurious RBW = 100 kHz, VBW≥RBW, Sweep = auto, Detector function = peak, Trace = max hold.
- 2 Allow the trace to stabilize, use the peak and delta measurement to record the result.
- 3 The level displayed must comply with the limit specified in this Section.

#### Limit

According to §15.247(d), in any 100 kHz bandwidth outside the frequency bands in which the spread spectrum intentional radiator in operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in 15.209(a) (see Section 15.205(c)).

#### Test result

China

### 9.7 Spurious radiated emissions for transmitter

#### **Test Method**

- 1. The EUT was place on a turn table which is 1.5m above ground plane for above 1GHz and 0.8m above ground for below 1GHz at 3 meter chamber room for test. The table was rotated 360 degrees to determine the position of the highest radiation.
- 2. The EUT was set 3 meters away from the interference receiving antenna, which was mounted on the top of a variable height antenna tower.
- 3. The height of antenna is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- 4. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- 5. Use the following spectrum analyzer settings According to C63.10:

#### For Below 1GHz

Use the following spectrum analyzer settings:

Span = wide enough to capture the peak level of the in-band emission and all spurious RBW = 100 kHz to 120 kHz, VBW≥RBW for peak measurement, Sweep = auto, Detector function = peak, Trace = max hold.

#### For Peak unwanted emissions Above 1GHz:

Span = wide enough to capture the peak level of the in-band emission and all spurious RBW = 1MHz, VBW≥RBW for peak measurement, Sweep = auto, Detector function = peak, Trace = max hold.

Procedures for average unwanted emissions measurements above 1000 MHz

- a) RBW = 1MHz.
- b) VBW  $\geq$  [3  $\times$  RBW].
- c) Detector = RMS (power averaging), if [span / (# of points in sweep)] ≤ RBW / 2. Satisfying this condition can require increasing the number of points in the sweep or reducing the span. If the condition is not satisfied, then the detector mode shall be set to peak.
- d) Averaging type = power (i.e., rms) (As an alternative, the detector and averaging type may be set for linear voltage averaging. Some instruments require linear display mode to use linear voltage averaging. Log or dB averaging shall not be used.)
- e) Sweep time = auto.
- f) Perform a trace average of at least 100 traces if the transmission is continuous. If the transmission is not continuous, then the number of traces shall be increased by a factor of 1 / D, where D is the duty cycle. For example, with 50% duty cycle, at least 200 traces shall be averaged. (If a specific emission is demonstrated to be continuous—i.e., 100% duty cycle—then rather than turning ON and OFF with the transmit cycle, at least 100 traces shall be averaged.)
- g) If tests are performed with the EUT transmitting at a duty cycle less than 98%, then a correction factor shall be added to the measurement results prior to comparing with the emission limit, to compute the emission level that would have been measured had the test been performed at 100% duty cycle. The correction factor is computed as follows:
- 1) If power averaging (rms) mode was used in the preceding step e), then the correction

factor is [10 log (1 / D)], where D is the duty cycle. For example, if the transmit duty cycle was 50%, then 3 dB shall be added to the measured emission levels.

- 2) If linear voltage averaging mode was used in the preceding step e), then the correction factor is [20 log (1 / D)], where D is the duty cycle. For example, if the transmit duty cycle was 50%, then 6 dB shall be added to the measured emission levels.
- 3) If a specific emission is demonstrated to be continuous (100% duty cycle) rather than turning ON and OFF with the transmit cycle, then no duty cycle correction is required for that emission.

#### Limit

The radio emission outside the operating frequency band shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Radiated emissions which fall in the restricted bands, as defined in section15.205 must comply with the radiated emission limits specified in section 15.209.

| Frequency   | Field Strength | Measured Distance<br>Meters |
|-------------|----------------|-----------------------------|
| MHz         | uV/m           | Meters                      |

### Spurious radiated emissions for transmitter

According to C63.10, if the peak (or quasi-peak) measured value complies with the average limit, it is unnecessary to perform an average measurement, so AV emission value did not show in below table if the peak value complies with average limit.

### Transmitting spurious emission test result as below:

Note 1: Measure Level (dBuV/m) = Reading Level (dBuV) + Factor (dB)

Factor (dB) = Cable Loss (dB) + Antenna Factor (dB/m)

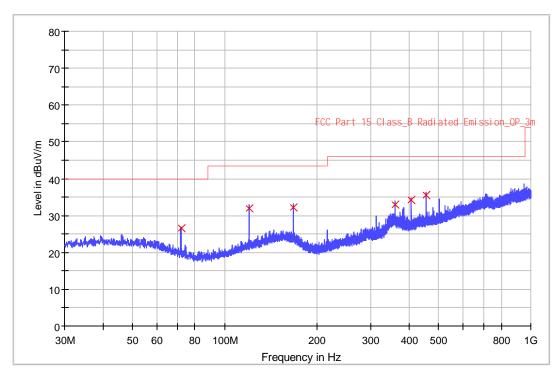

Note 2: The test trace is same as the ambient noise and the amplitude of the emissions are attenuated more than 20dB below the permissible (the test frequency range:  $9kHz \sim 30MHz$ ,  $18GHz \sim 25GHz$ ), therefore no data appear in the report.

## 10 Test Equipment List

### C - Conducted RF tests

- · Conducted peak output power
- · 6dB bandwidth and 99% Occupied Bandwidth
- · Power spectral density\*
- · Spurious RF conducted emissions
- Band edge

## 11 System Measurement Uncertainty

For a 95% confidence level, the measurement expanded uncertainties for defined systems, in accordance with the recommendations of ISO 17025 were:

| Items                                       | Extended Uncertainty   |  |  |
|---|--|--|--|
| Conducted Disturbance at Mains<br>Terminals | 150kHz to 30MHz, LISN, ±3.16dB   |  |  |
| Radiated Disturbance                        | 30MHz to 1GHz, ±5.03dB (Horizontal)<br>±5.12dB (Vertical)<br>1GHz to 18GHz, ±5.49dB<br>18GHz to 40GHz, ±5.63dB |  |  |
| Carrier power conducted measurement         | 50MHz~18GHz, ±1.238dB  |  |  |
| Spurious Emission Conducted<br>Measurement  | 9kHz ~40GHz, ± 1.224dB   |  |  |
