12.8. Appendix F: Dynamic Frequency Selection

12.8.1. Test Result

DFS In-Service Monitoring (5510 MHz; 40 MHz)

Test according to FCC title 47 part 15 §15.407(h), KDB 905462 D02 U-NII DFS Compliance Procedures New Rules v02

Note: The master-client pair communicate with the master device transmitting on a non-DFS channel while performing DFS CAC and in service monitoring on the DFS channel. The client device (EUT) downlink channel in the non-DFS band is used to listen to the master device and only transmits on the uplink DFS channel after receiving confirmation from the master that the DFS uplink channel is available following the master device CAC. Once the DFS band uplink channel is available the client device continues to monitor the downlink channel for information to clear the channel whenever the master device detects radar on the uplink channel. For the purposes of testing the master-client downlink was established on ISM frequency band (narrowband signal frequency band in 2403.5MHz-2471.12MHz or 5726.5MHz-5848.12MHz) and the client-master uplink was established on the DFS channel to be tested (5510 MHz). Radar was applied to the master device on the uplink channel (5510 MHz) and time for the client to clear the channel was measured. Testing was done as required by KDB 905462 with the client operating on the widest available channel bandwidth (40MHz).

Additional Information

| Note | Description |
|---------|--|
| Note 1: | Because of the radar pulse event at the beginning, the investigation of the trace begins with an offset of 28.7 ms conforming to the end of the Radar burst. |
| Note 2: | Channel move time (CMT) / channel closing transmission time (CCTT) measurement was made with hi resolution video sweep using OSP DAQ channel |
| Note 3: | Because of the substantially higher sampling rate of the video signal the results for CCTT and CMT are more accurate than in the graphics visible. Reached timing accuracy of the video trace: approx 4 µs |
| Note 4: | The Non-Occupancy Period trace starts at the end of the Channel move time trace (20.000 secs.) Labeling of the x-axis (time) is relative to its beginning (0 secs.) |
