

Project No.	23E10540-3b
Quotation	Q23-1805-1
Prepared For	Sensoteq Ltd
Company Address	Unit 23, Ormeau Business Park, Cromac Ave, BT7 2JA Belfast
Contact	Alan McCall
Contact Email	amccall@sensoteq.co.uk
Contact Phone	+44 2896 208 453
Prepared By	Compliance Engineering Ireland
Test Lab Address	Clonross Lane, Derrockstown, Dunshaughlin, Co. Meath, Ireland
Tested By	Joy Dalayap
Test Report By	Michael Kirby
FCC Designation number	IE0002
ISED CAB identifier:	IE0001
Date	18th Dec 2023
EUT Description	RF Sensor
FCC ID	2ANL3SPR433TA
IC ID	23633-SPR433TA
Authorised by	Paul Reilly
Authorised Signature:	

RF Exposure Exhibit– Technical Report

1.0 Overview

The EUT is designed for fixed / mobile applications application environments.

1.1 Fixed / Mobile Application

MPE for bystanders which are considered to be ≥ 20 cm away from the front of the transmit antenna

2 Overview FCC MPE

47 CFR Sections 1.1307, 1.1310, 2.1091,

447498 D01 General RF Exposure Guidance v06

2.1 Maximum Permissible Exposure 433.4MHz

where:

S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

$$S = \frac{PG}{4\pi R^2}$$

Note the Radiated field strength was measured at 3 metres and the conversion formula below was used to determine the EIRP in dBm

$$EIRP (dBm) = E_{3m} (dBuV/m) - 95.2$$

Radiated Field Strength at 3m	69	dBuV/m
Power Conversion factor for antenna distance 3m	-95.2	dB
Time Averaging Factor	0	dB
Tune up factor	0	dB
EIRP Peak	-26.20	dBm
EIRP Peak	0	mW
Prediction distance:	20	cm
Prediction frequency:	433.4	MHz
Power density at prediction frequency:	0.000	mW/cm ²
Power density at prediction frequency:	0.000	W/m ²
MPE limit for Uncontrolled/General Population exposure at prediction frequency:	0.290	mW/cm ²
Result => Exempt from RF Exposure evaluation		

Notes

The table above shows that for a prediction distance of 20cm, RF exposure evaluation is not required.

2.2 Maximum Permissible Exposure BLE

where:

S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

$$S = \frac{PG}{4\pi R^2}$$

Note the Radiated field strength was measured at 3 metres and the conversion formula below was used to determine the EIRP in dBm

$$EIRP (dBm) = E_{3m} (dBuV/m) - 95.2$$

Radiated Field Strength at 3m	83.5	dBuV/m
Power Conversion factor for antenna distance 3m	-95.2	dB
Time Averaging Factor	0	dB
Tune up factor	0	dB
EIRP Peak	-11.70	dBm
EIRP Peak	0	mW
Prediction distance:	20	cm
Prediction frequency:	2480	MHz
Power density at prediction frequency:	0.000	mW/cm ²
Power density at prediction frequency:	0.000	W/m ²
MPE limit for Uncontrolled/General Population exposure at prediction frequency:	1.000	mW/cm ²
Result => Exempt from RF Exposure evaluation		

The table above shows that for a prediction distance of 20cm, RF exposure evaluation is not required.

2.3 Maximum Permissible Exposure 433.4MHz and BLE co-locating

Adding the individual fractions of the respective limits, the combined total is less than 1.

$$0/0.29 + 0/1 = 0 < 1$$

This result shows that for a prediction distance of 20cm, RF exposure evaluation is not required when the 433.4 and BLE transmitters are co-locating.

3.0 Maximum Permissible Exposure IC

Limits for Routine Evaluation — RF Exposure Evaluation

Limits as per RSS 102 Issue 5 (Mar 2015) Section 2.5.2 Amd 1 Feb 2021

3.1 Maximum Permissible Exposure 433.4MHz

where:

$$S = \frac{PG}{4\pi R^2}$$

S = power density
P = power input to the antenna
G = power gain of the antenna in the direction of interest relative to an isotropic radiator
R = distance to the center of radiation of the antenna

Note the Radiated field strength was measured at 3 metres and the conversion formula below was used to determine the EIRP in dBm

$$EIRP (dBm) = E_{3m} (dBuV/m) - 95.2$$

Radiated Field Strength at 3metres	69	dBuV/m
Adjustment for antenna distance 3m	-95.2	dB
EIRP Peak	-26.2	dBm
Time Averaging Factor	0.00	dB
Tune up factor	0	dB
EIRP Peak	-26.20	dBm
EIRP Peak	2.40	uW
Prediction frequency:	433.4	MHz
RSS102 2.5.2 Limit for Routine Evaluation	0.83	W
Exempt from Routine RF Exposure Evaluation		

Notes

The table above shows that for a prediction distance of 20cm, RF exposure evaluation is not required.

3.2 Maximum Permissible Exposure BLE

where:

$$S = \frac{PG}{4\pi R^2}$$

S = power density
P = power input to the antenna
G = power gain of the antenna in the direction of interest relative to an isotropic radiator
R = distance to the center of radiation of the antenna

Note the Radiated field strength was measured at 3 metres and the conversion formula below was used to determine the EIRP in dBm

$$EIRP (dBm) = E_{3m} (dBuV/m) - 95.2$$

Radiated Field Strength at 3metres	83.5	dBuV/m
Adjustment for antenna distance 3m	-95.2	dB
EIRP Peak	-11.7	dBm
Time Averaging Factor	0.00	dB
Tune up factor	0	dB
EIRP Peak	-11.70	dBm
EIRP Peak	0.07	mW
Prediction frequency:	2480	MHz
RSS102 2.5.2 Limit for Routine Evaluation	2.74	W
Exempt from Routine RF Exposure Evaluation		

3.3 Maximum Permissible Exposure 433.4MHz and BLE co-locating

Adding the individual fractions of the respective limits, the combined total is less than 1.

$$0/0.83 + 0.0007/2.74 = 0 < 1$$

This result shows that for a prediction distance of 20cm, RF exposure evaluation is not required when the 433.4MHz and BLE transmitters are co-locating.
