### EUT Test Conditions During Testing

The EUT was in continuous transmit mode during all the tests. The EUT was configured into the wanted channel using software provided by the manufacturer. Normal modulation and duty cycle was applied in all the tests. Tests were performed using power setting 0 in low and high channel and power setting 1 in middle channel.

Conducted measurements were performed using SMA adapter with a short cable connected to EUTs RF connector.

Radiated measurements were performed with EUT integrated 1.9 dBi antenna.

Following channels were used during the tests when the hopping was stopped:

Channel Low (Ch 1) = 2412 MHz

Channel Mid (Ch 6) = 2437 MHz

Channel High (Ch 11) = 2462 MHz

**FCC Rule: 15.247(b)(3)****RSS-247 5.4(d)**

For systems using digital modulation in the 2400-2483.5 MHz bands the limit is 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power.

Measurements were performed using averaging power meter.

**Transmitter Radiated Spurious Emissions 9 kHz – 26500 MHz**

**Standard:** ANSI C63.10 (2013)  
**Tested by:** MIH  
**Date:** 17 September – 23 November 2017  
**Temperature:** 23 ± 3 °C  
**Humidity:** 30 - 60 % RH  
**Measurement uncertainty:** ± 4.51 dB      **Level of confidence 95 % (k = 2)**

**FCC Rule: 15.247(d), 15.209(a)****RSS-247 5.5**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a).

The correction factor in the final result table contains the sum of the transducers (antenna + amplifier + cables). Peak values of emissions below 1000 MHz measured for reference as well as transmitter fundamental.

**FCC Rule: 15.247(d), 15.209(a)****RSS-247 5.5**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).
