Divigraph (Pty) LTD

TEST REPORT FOR

Industrial Edge Machine with IEEE 802.15.4 and BLE radio, 2.4GHz Wi-Fi/Bluetooth and LTE/WCDMA cellular interface, Model: 110A1000-01
Panel Antenna (TE MD24-12), Model: 110A1003
RF Extension Cable (175101-10-24.00), Model: 175101-10-24.00
Antenna Whip 5G WB Cell IP67 N Plug, Model: 110A1008
Dipole Antenna (HUBER+SUHNER 1399.17.0224), Model: 100A1001
Yagi Antenna (HUBER+SUHNER 1324.17.0116), Model: 110A1007

Tested to The Following Standards:

FCC Part 15 Subpart C Section(s)

15.207 & 15.247
(DTS 2400-2483.5 MHz)

Report No.: 109523-6

Date of issue: April 9, 2024

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Test Certificate # 803.01

Testing the Future

REPORT PREPARED FOR:

Divigraph (Pty) LTD
Prosperity Park, Computer Road
Milnerton Cape Town, 7441
South Africa

Representative: Dennis Naude
Customer Reference Number: 2359

REPORT PREPARED BY:

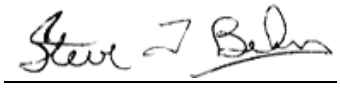
Viviana Prado
CKC Laboratories, Inc.
5046 Sierra Pines Drive
Mariposa, CA 95338

Project Number: 109523

DATE OF EQUIPMENT RECEIPT: March 15, 2024
DATE(S) OF TESTING: March 15, 21, and 26, 2024

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the equipment provided by the client, tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.



Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable, and affordable test results.

TEST LOCATION(S):
CKC Laboratories, Inc.
1120 Fulton Place
Fremont, CA 94539

Summary of Results

Standard / Specification: FCC Part 15 Subpart C - 15.247 (DTS 2400-2483.5 MHz)

Test Procedure	Description	Modifications	Results
15.247(a)(2)	6dB Bandwidth	NA	NP
15.247(b)(3)	Output Power	NA	NP
15.247(d)	RF Conducted Emissions & Band Edge	NA	NP
15.247(d)	Radiated Emissions & Band Edge	NA	Pass
15.247(e)	Power Spectral Density	NA	NP
15.207	AC Conducted Emissions	NA	Pass

NA = Not Applicable
NP = CKC Laboratories was not contracted to perform the required testing since the EUT has a certified modular (FCC ID: 2AOADNG01) with new antennas.

ISO/IEC 17025 Decision Rule
The equipment sample utilized for testing is selected by the manufacturer. The declaration of pass or fail herein is a binary statement for simple acceptance rule (ILAC G8) based upon assessment to the specification(s) listed above, without consideration of measurement uncertainties. For performance related tests, equipment was monitored for specified criteria identified in that section of testing.

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
No modifications were made during testing.

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
None

Equipment Under Test (EUT)

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

Configuration 3

Equipment Tested:

Device	Manufacturer	Model #	S/N
Industrial Edge Machine with IEEE 802.15.4 and BLE radio, 2.4GHz Wi-Fi/Bluetooth and LTE/WCDMA cellular interface	Divigraph (Pty)LTD	110A1000-01	AD24BD0B

General Product Information:

Description of EUT
Industrial Edge Machine

Product Information	Manufacturer-Provided Details
Operating Frequencies Tested:	2405-2475MHz
Equipment Type:	Stand-Alone Equipment
Type of Wideband System:	802.15.04
Maximum Duty Cycle:	100%
Modulation Type(s):	OQPSK, DSSS
Number of TX Chains:	1
Beamforming Type:	NA
Antenna Type(s) and Gain:	11dBi and 14dBi
Antenna Connection Type:	External Connector
Nominal Input Voltage:	24VDC
Firmware / Software Version(s):	NA
Firmware / Software Description:	NA
Firmware / Software Setting(s):	Putty (64-bit)
Tune-up or Adjustment(s):	None
The validity of results is dependent on the stated product details, the accuracy of which the manufacturer assumes full responsibility.

FCC Part 15 Subpart C

15.247(d) Radiated Emissions & Band Edge

Test Setup / Conditions / Data

Test Location:	CKC Laboratories, Inc. • 1120 Fulton Pl • Fremont, CA 94539 • (510) 249-1170		
Customer:	**Divigraph (Pty) LTD**		
Specification:	**15.247(d) / 15.209 Radiated Spurious Emissions**		
Work Order #:	**109523**	Date:	3/21/2024
Test Type:	**Radiated Scan**	Time:	09:23:03
Tested By:	Hieu Song Nguyenpham	Sequence#:	41
Software:	EMITest 5.03.20		

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 3			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 3			

Test Conditions / Notes:

RSE
Frequency Range: 9kHz to 1GHz

Test Environment Conditions:
Temperature: 21.1°C
Humidity: 42%
Atmospheric Pressure: 101.9kPa

Highest Generation Frequency: 2.48GHz

Test Method: ANSI C63.10 (2020), KDB 558074

The EUT is set up and operated as intended. It is powered by PoE Injector is a support equipment and outside of the chamber. The PoE injector is connected to the Ethernet Switch which is also outside of the chamber through an Ethernet cable. The Ethernet switch is connected to the NUC to monitor and control the EUT during exposure.

Perform 3 orientations of a receiving antenna from 9kHz to 30MHz. No emissions detected within 20dB of the limit in frequency range 9kHz to 30MHz.

Note:
Low Channel
Panel Antenna (TE MD24-12) 11dBi

Atmospheric Pressure: 101.5kPa

Highest Generation Frequency: 2.48GHz

Test Method: ANSI C63.10 (2020), KDB 558074

The EUT is set up and operated as intended. It is powered by PoE Injector is a support equipment and outside of the chamber. The PoE injector is connected to the Ethernet Switch which is also outside of the chamber through an Ethernet cable. The Ethernet switch is connected to the NUC to monitor and control the EUT during exposure.

Band Edge Setup

Test Environment Conditions:
Temperature: 21.1°C
Humidity: 45%
Atmospheric Pressure: 101.5kPa

Highest Generation Frequency: 2.48GHz

Test Method: ANSI C63.10 (2020), KDB 558074

The EUT is set up and operated as intended. It is powered by PoE Injector which is a support equipment which is outside of the chamber. The PoE injector is connected to the Ethernet Switch which is also outside of the chamber through an Ethernet cable. The Ethernet switch is connected to the NUC to monitor and control the EUT during exposure

Supplemental Information

Measurement Uncertainty

Uncertainty Value	Parameter
5.77 dB	Radiated Emissions
0.673 dB	RF Conducted Measurements
5.77 x 10^{-10}	Frequency Deviation
0.00005 s	Time Deviation
3.18 dB	Mains Conducted Emissions

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dBµV/m, the spectrum analyzer reading in dBµV was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBµV)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBµV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.

End of Report
