According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance,mm)] $\cdot \lceil \sqrt{f(GHz)} \rceil \le 3.0$

The max. average power of channel, including tune-up tolerance(mW) is 5.495 mW @ 2480 MHz (With Tune-up tolerance),

The min. test separation distance (mm) is 5 mm,

So, [(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] $\cdot [\sqrt{f(GHz)}] = 1.731 < 3.0$ (With Tune-up tolerance).

Therefore, standalone SAR measurements are not required for both head and body.
