## 1 SUMMARY

See Appendix 1 for photos.

Emission measurements as specified below have been performed.

### 1.1 Test plan

Standard	Name of the test	Results
FCC 47 CFR Part 15C	15.249 Operation within the band 2400-2483.5 MHz	PASSED
15.35 (c)	Duty cycle measurement	-
15.249 (a)	Field strength of fundamental	PASSED
15.249 (d) (e)	Radiated emission	PASSED
15.207	AC conducted emission	PASSED
15.215 (c)	20 dB bandwidth	PASSED
2.1049	Occupied bandwidth	PASSED
2.1049	Band Edge	PASSED

PASSED The test was performed and the test specimen complies with the essential requirements in the standard.

FAILED The test was performed and the test specimen does not comply with the essential requirements in the standard.

REF The test is covered by a test in another report and/or on a similar test specimen.

NR The test is not relevant for the test specimen or has been waived by the manufacturer.

## 1.2 Test Specimen

<b>Manufacturer</b>	Shape Robotics
<b>Name</b>	Joint
<b>Model No.</b>	JNT002
<b>Hardware ver.</b>	2.3.4
<b>Test Software</b>	Joint_Firmware-idel-6dbm_full_duty.hex
<b>Supply voltage</b>	5 VDC by USB or internal Li-ion battery

The Joint is an item containing two motor controlled joints, which enables the Joint to move the top. The movement is controlled by a PC program. The communication is performed via a 2.4 GHz radio link to a Dongle connected to a PC by a USB cable.

The Joint is powered by an internal Li-ion battery and charged via USB connector.

The 2.4 GHz radio used in both Joint and Dongle is the same type module from ITEAD. The radio is based on a chipset from Nordic Semiconductor nRF24L01+.

The 2.4 GHz radio uses 6 pre-allocated frequencies in the range 2405 MHz to 2479 MHz.

The switching between the frequencies is done manually. (Pressing a button).

As the frequency range is greater than 10 MHz 3 frequencies are selected for test.

1. 2405 MHz
2. 2449 MHz
3. 2479 MHz

See photo 1 in appendix 1.

### 1.3 Auxiliary Equipment

#### 1.3.1 AC/DC adaptor

<b>Manufacturer</b>	Shape Robotics
<b>Model</b>	UBP-008
<b>Details</b>	-
<b>Supply voltage</b>	100 – 240 VAC (120 VAC 60 Hz was used during tests)
<b>Output voltage</b>	5 VDC

See photo in appendix 1.

### 1.4 I/O ports / cables to test specimen

I/O Port Cable	Type	Shielding	Cable length
USB	Std.	Shielded	40 cm

### 1.5 Test set-up

During test the test specimen was powered with 5 VDC via the USB cable, except during AC conducted emission where the AC/DC adaptor was used.

During the tests, except the Duty Cycle test, the 2.4 GHz module (nRF24L01+) was set to transmit maximal power at one frequency, with the maximal duty cycle which was possible with normal modulation.

## 2 TESTS

### 2.1 Duty Cycle

<b>Test specimen</b>	Joint JNT002
<b>Test specification</b>	47 CFR Part 15 Subpart C
<b>Test method</b>	ANSI C63.10:2013
<b>Comments</b>	None
<b>Temperature / Humidity</b>	22°C / 35%RH
<b>Dates of measurements</b>	2018-03-14
<b>Test personnel</b>	Ruben Hansen

#### 2.1.1 Test setup

As it was not possible to configure the 2.4 GHz radio module to 100 % duty cycle, a special test set up was made for the duty cycle measurement.

The worst case, during normal use, will be that the number of Joints attached to the Dongle will go towards infinity. If that occurs the limiting factor will be the USB protocol since there is a 2 ms delay for each package.

For the test set up a Dongle was connected to a Laptop via USB cable and to a Joint via 2.4 GHz radio. At the laptop a special program was running, which was sending packages as fast as possible to the Joint via the Dongle and USB cable. The Joint was replying with full package. The package length was set to the maximal 32 Bytes.

The measurements were performed radiated with a small antenna placed next to the Dongle. There were a clear difference between the measured pulse level from the Dongle and the Joint.

See photo of test set up in appendix 1.

#### 2.1.2 Test result

The duty cycle was measured at 2468.23 MHz.

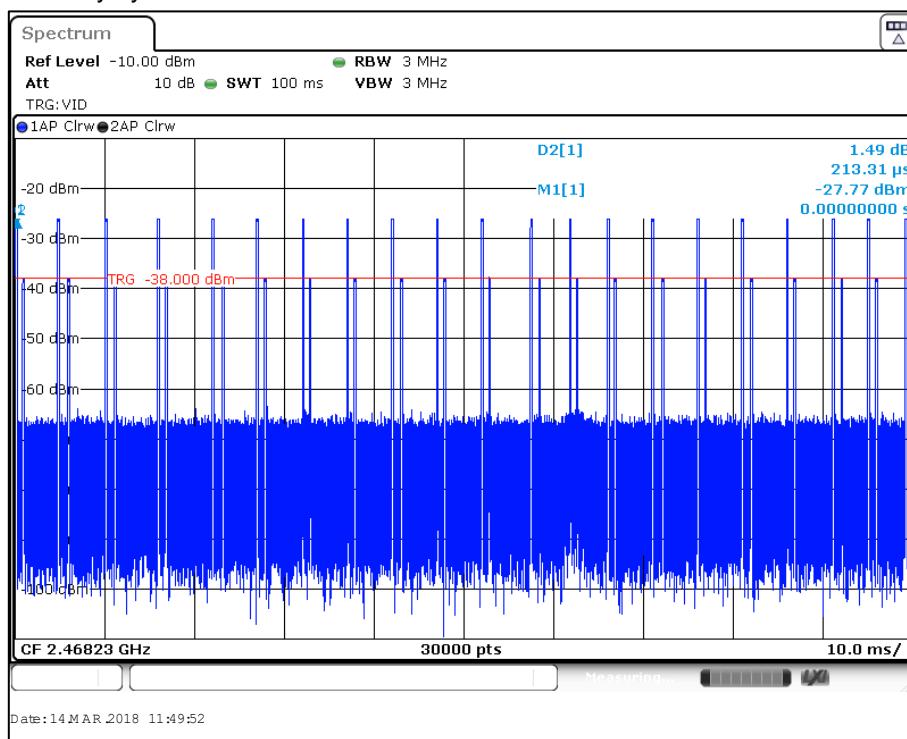

Figure 1. Duty Cycle.

The total pulse time was calculated in a spreadsheet based on the 30000 measurements points from the Analyzer.

Total pulse time [ms]	Period time [ms]	Duty cycle [%]	Duty cycle correction factor [dB]
4.67	100	4.67	-26.61

Table 1. Duty cycle.

### 2.1.3 Test equipment

Description	Supplier	Model	Tag no.	Cal. due date
Receiver EMI Test 10Hz-13.6GHz	Rohde & Schwarz	FSV 13	50092	2018-08-24

## 2.2 Field strength of fundamental

<b>Test specimen</b>	Joint JNT002
<b>Test specification</b>	FCC 47 CFR Part 15.249
<b>Test method</b>	ANSI C63.10:2013
<b>Frequency range</b>	2400-2483.5 MHz
<b>Limits</b>	FCC 47 CFR Part 15.249 (a)
<b>Comments</b>	None
<b>Temperature / Humidity</b>	22°C / 37%RH
<b>Dates of measurements</b>	2018-01-26
<b>Test personnel</b>	Søren Søltoft

### 2.2.1 Test setup

The radiated maximum peak output power measurements were performed in the semi-anechoic chamber with absorber on floor.

The fundamental was scanned with peak detector with the EUT in 3 octagonal positions and the turntable was varied between 0-360 degrees for maximum response.

The antenna distance during the measurements was 3.0 m.

The EUT height above the reference ground plane was 1.5 m

See appendix 1 for photo of test set up and test specimen orientation

### 2.2.2 Test limit

Frequency range	Field strength limit	Field strength limit
2400 – 2483.5 MHz	50 mV/m	94 dB $\mu$ V/m

**Table 2. Field strength of fundamental limit.**

### 2.2.3 Test results

<b>Fundamental: 2405 MHz</b>			
<b>EUT axis</b>	<b>Vertical</b>	<b>Vertical -90 deg.</b>	<b>Horizontal</b>
<b>Antenna polarization</b>	Horizontal	Horizontal	Vertical
<b>Max. peak power</b>	91.13 dB $\mu$ V/m	90.51 dB $\mu$ V/m	91.96 dB $\mu$ V/m
<b>Result</b>	PASSED	PASSED	PASSED

<b>Fundamental: 2449 MHz</b>			
<b>EUT axis</b>	<b>Vertical</b>	<b>Vertical -90 deg.</b>	<b>Horizontal</b>
<b>Antenna polarization</b>	Horizontal	Horizontal	Horizontal
<b>Max. peak power</b>	90.67 dB $\mu$ V/m	88.59 dB $\mu$ V/m	89.88 dB $\mu$ V/m
<b>Result</b>	PASSED	PASSED	PASSED

<b>Fundamental: 2479 MHz</b>			
<b>EUT axis</b>	<b>Vertical</b>	<b>Vertical -90 deg.</b>	<b>Horizontal</b>
<b>Antenna polarization</b>	Horizontal	Horizontal	Vertical
<b>Max. peak power</b>	88.87 dB $\mu$ V/m	89.64 dB $\mu$ V/m	89.76 dB $\mu$ V/m
<b>Result</b>	PASSED	PASSED	PASSED

See appendix 1 for photo of test set up and test specimen orientation

The nominal voltage of 5 VDC were variated between 85% and 115% without any changes in output power.

### 2.2.4 Test equipment

<b>Description</b>	<b>Supplier</b>	<b>Model</b>	<b>Tag no.</b>	<b>Cal. due date</b>
Antenna Horn	Schwarzbeck	BBHA 9120 D	20777	2019-02-18
Analyzer 20Hz-26.5GHz	Rohde & Schwarz	ESI	20763	2018-09-05

## 2.3 Radiated emission

<b>Test specimen</b>	Joint JNT002
<b>Test specification</b>	47 CFR Part 15.249 (d) (e)
<b>Test method</b>	ANSI C63.10:2013
<b>Frequency range</b>	30 MHz – 25 GHz
<b>Limits</b>	47 CFR Part 15.249 (a) and 15.209
<b>Comments</b>	None
<b>Temperature / Humidity</b>	19°C / 42%RH, 20°C / 39%RH, 21°C / 38%RH
<b>Dates of measurements</b>	2018-02-08, 2018-02-09, 2018-02-23
<b>Test personnel</b>	Søren Søltoft

### 2.3.1 Test setup

A measuring distance of 3 m was used during the tests.

The EUT was placed on a non-conductive table.

For measurements below 1 GHz. the height was 0.8 m and above 1 GHz the height was 1.5 m.

The test of radiated emission was performed in a semi anechoic chamber with absorbers on floor above 1 GHz. The measurements were performed with both horizontal and vertical polarizations of the antenna. The antenna distance during the measurements was 3.0 m.

The test specimen was tested in a combination of 3 different orientations and 3 frequencies.

At 2405 MHz the orientation was vertical, at 2449 MHz the orientation was vertical – 90 deg. and at 2479 MHz the orientation was horizontal.

A pre-measurement was performed with peak detector. The test object was measured in eight directions with the antenna in the frequency range 30-1000 MHz and in eighteen directions at frequencies above 1 GHz, with the antenna at three heights, 1.0 m, 1.5 m and 2.0 m. In the frequency range of 14 GHz to 25 GHz the measurement distance was 0.5 m.

If the emission is close or above the limit during the pre-measurement, the test object was scanned 360 degrees and the antenna height scanned from 1 to 4 m for maximum response. Then the emission was measured with the quasi-peak detector on frequencies below 1 GHz and with the CISPR-average detector above 1 GHz.

The following RBW were used:

30 MHz-1 GHz: RBW = 120 kHz

1-25 GHz: RBW = 1 MHz

See appendix 1 for photo of test set up

### 2.3.2 Test results

#### 2.3.2.1 Test result for Low channel 2405 MHz in vertical position.

## 2.4 AC Conducted emission

<b>Test specimen</b>	Joint JNT002
<b>Test specification</b>	47 CFR Part 15.207
<b>Test method</b>	ANSI C63.4:2014
<b>Frequency range</b>	0.15 - 30 MHz
<b>Limits</b>	47 CFR Part 15.207
<b>Comments</b>	none
<b>Temperature / Humidity</b>	22°C / 41%RH
<b>Dates of measurements</b>	2018-02-12
<b>Test personnel</b>	Søren Søltoft

### 2.4.1 Test setup

Measurements were performed with the test specimen powered from a AC/DC adaptor while sending max power with max duty cycle at the middle channel (2449 MHz). The mains supply was 120 VAC 60 Hz.

See appendix 1 for photo of test set up

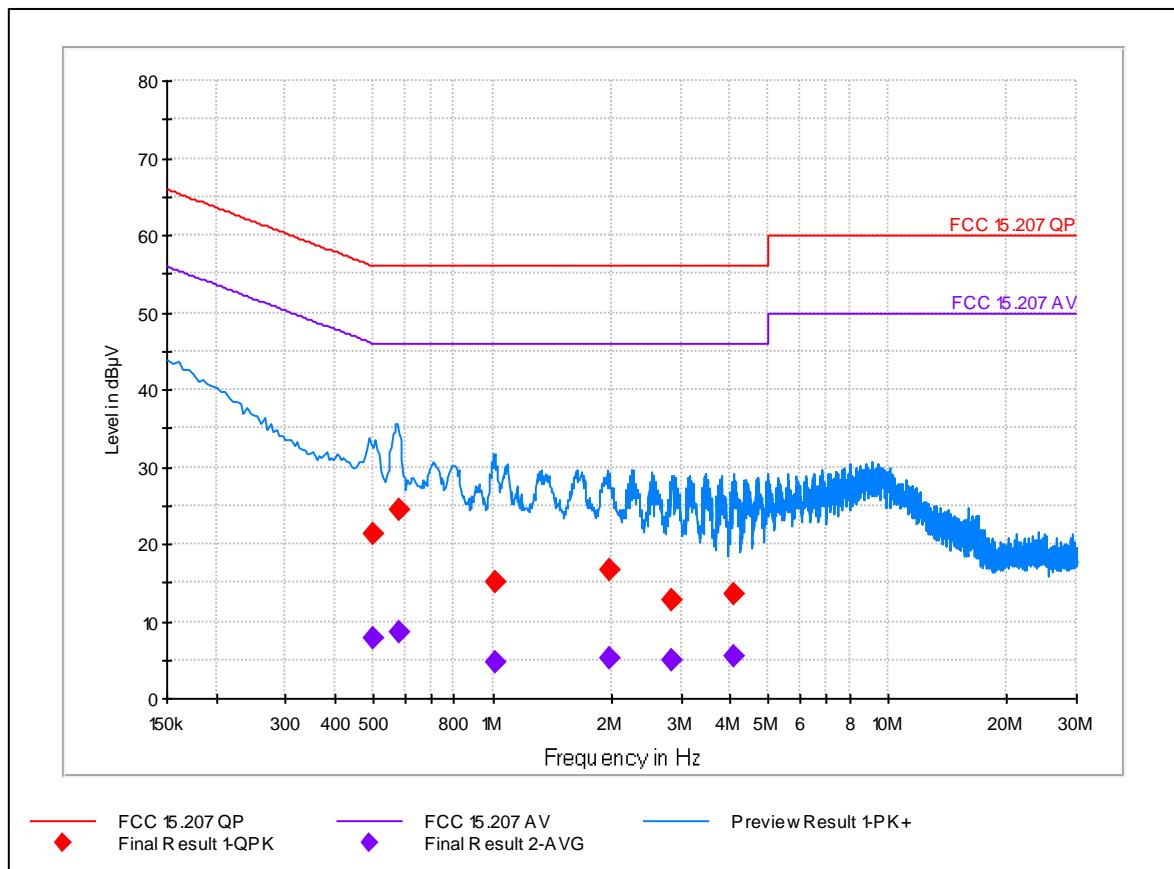

### 2.4.2 Test limits

Frequency (MHz)	Quasi-peak value (dB $\mu$ V)	Average value (dB $\mu$ V/m)
0.15-0.5	66-56*	56-46*
0.5-5	56	46
5-30	60	50

Table 35. Radiated emission limits.

## 2.5 20 dB bandwidth

<b>Test specimen</b>	Joint JNT002
<b>Test specification</b>	47 CFR Part 15.215
<b>Test method</b>	ANSI C63.10:2013
<b>Comments</b>	none
<b>Temperature / Humidity</b>	22°C / 37%RH
<b>Dates of measurements</b>	2018-01-26
<b>Test personnel</b>	Søren Søltoft

### 2.5.1 Test setup

A measuring distance of 3 m was used during the tests.

The EUT was placed 1.5 m above ground on a non-conductive table.

See appendix 1 for photo of test set up

### 2.5.2 Test results

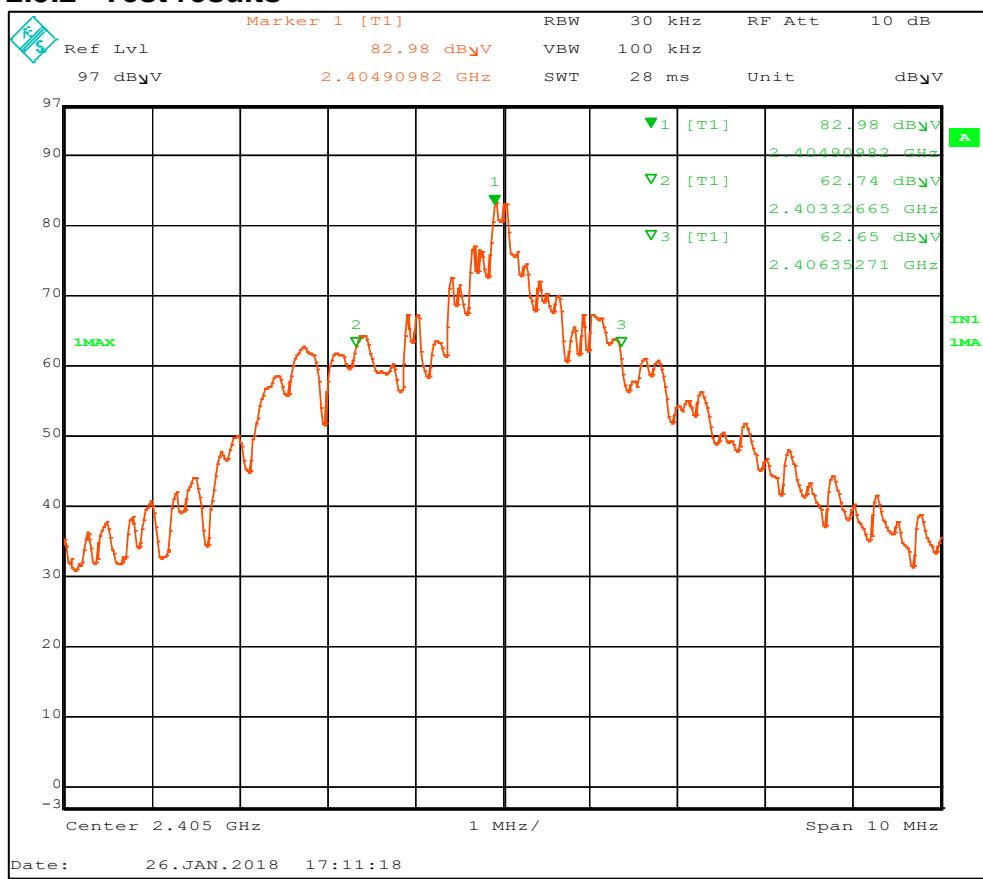

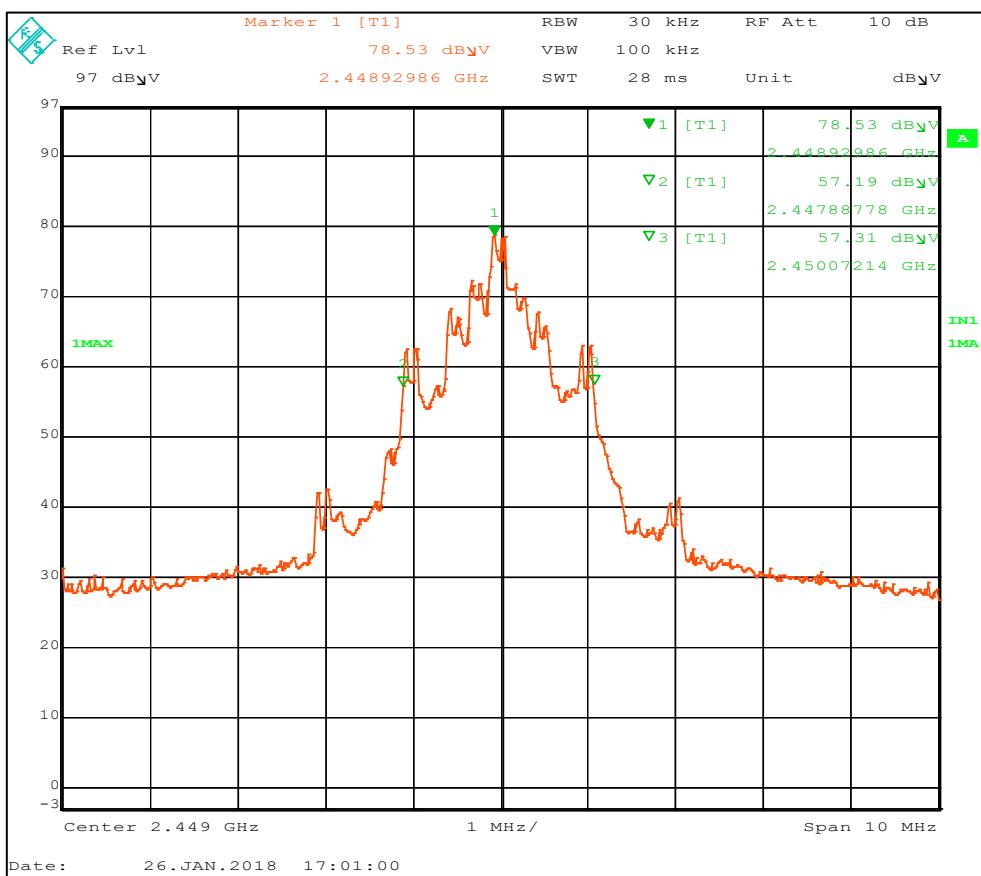

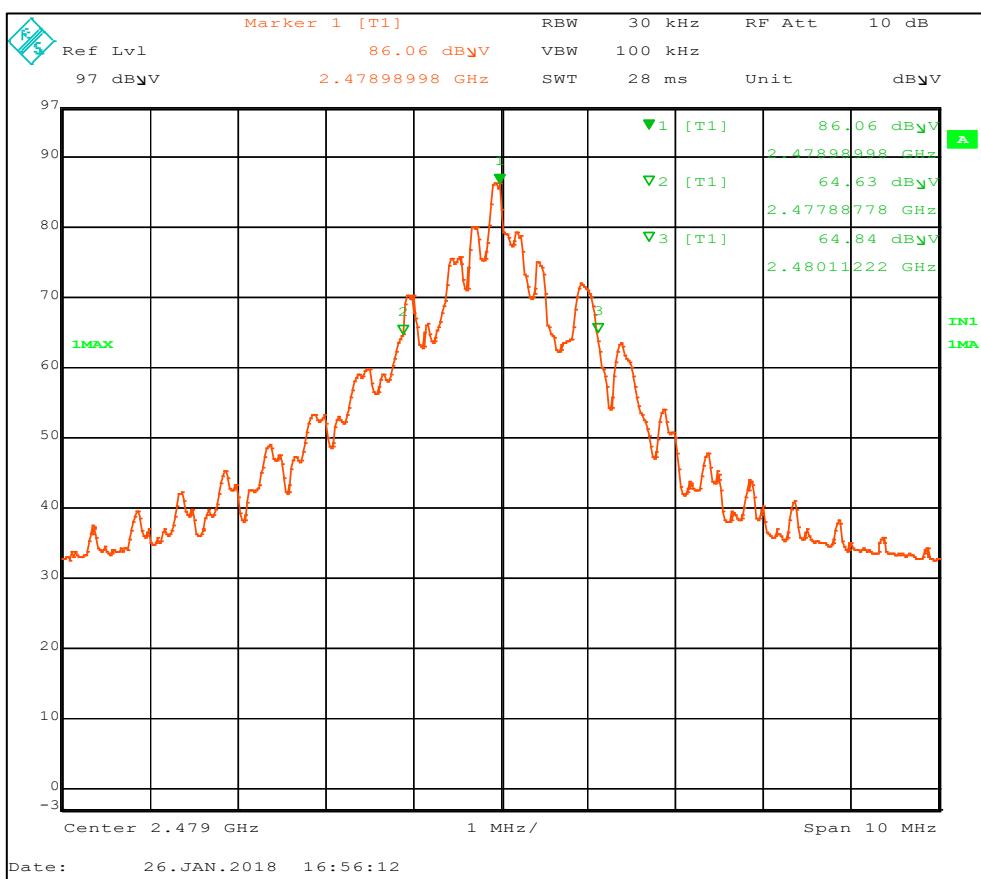

Figure 27. 20 dB bandwidth at 2405 MHz.

### 2.6.3 Test equipment

Description	Supplier	Model	Tag no.	Cal. due date
Antenna Horn	Schwarzbeck	BBHA 9120 D	20777	2019-02-18
Analyzer 20Hz-26.5GHz	Rohde&Schwarz	ESI	20763	2018-09-05

Table 40. 20 dB bandwidth test equipment.

## 2.7 Band edge

<b>Test specimen</b>	Joint JNT002
<b>Test specification</b>	47 CFR 2.1049
<b>Test method</b>	ANSI C63.10:2013
<b>Comments</b>	none
<b>Temperature / Humidity</b>	22°C / 37%RH
<b>Dates of measurements</b>	2018-01-26
<b>Test personnel</b>	Søren Søltoft

### 2.7.1 Test setup

A measuring distance of 3 m was used during the tests.

The EUT was placed 1.5 m above ground on a non-conductive table.

The turntable, antenna height and antenna polarity were adjusted for maximal radiated emission level.

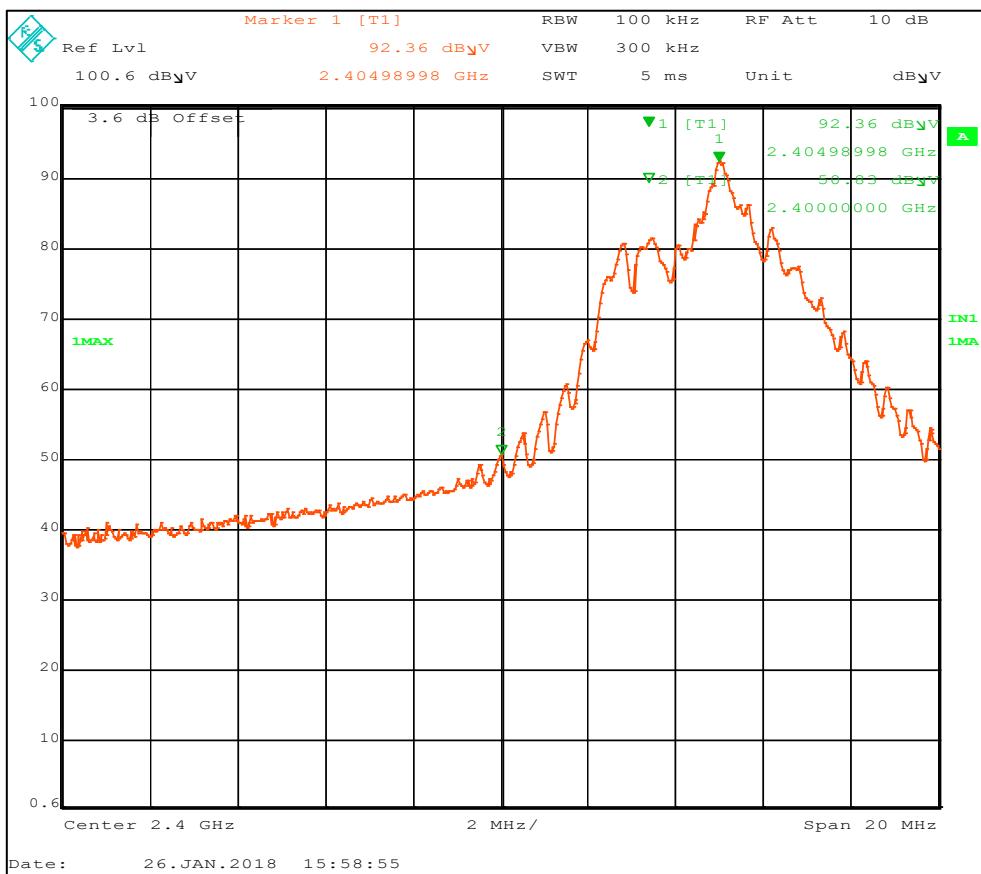

The graphs are offset with the correction factor to show the maximal level.

See appendix 1 for photo of test set up

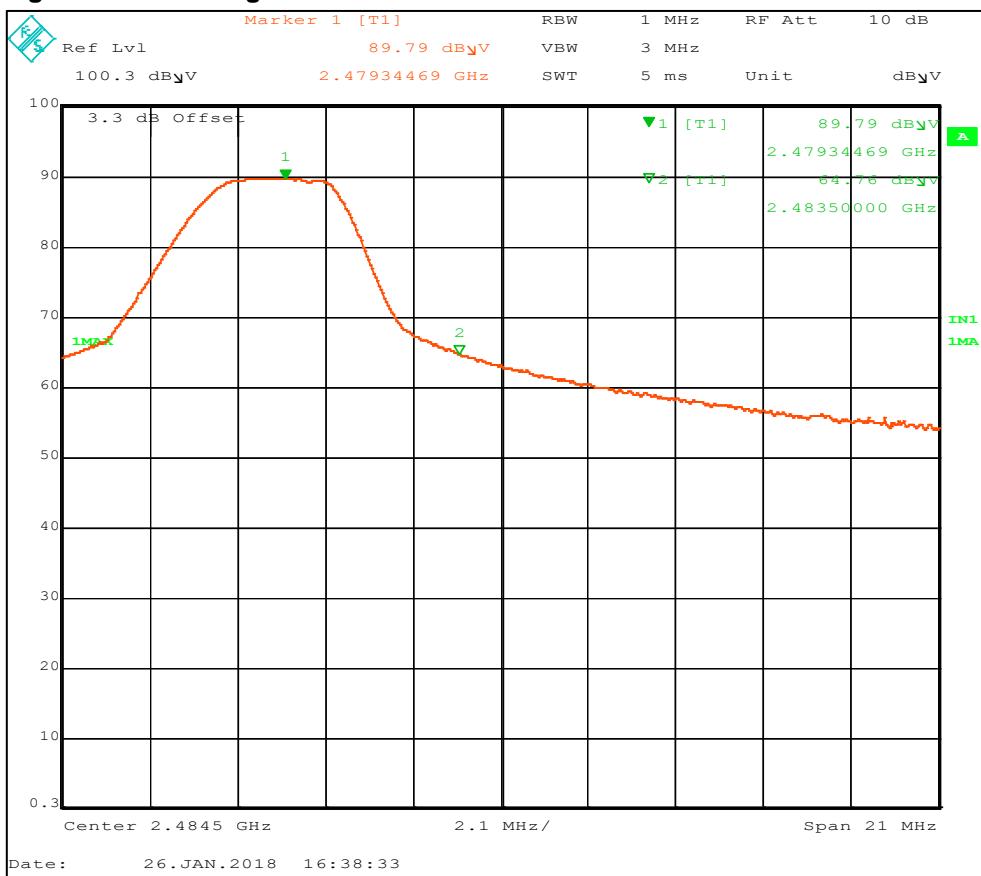

According to 15.205 the nearest restricted bands above and below the operational band are 2310 – 2390 MHz and 2483.5 – 2500 MHz. Thus the low channel at 2405 MHz was tested according to ANSI 63.10:2013 clause 6.10.4 Authorized-band band-edge measurements and the high channel at 2479 MHz was tested according to ANSI 63.10:2013 clause 6.10.5 Restricted-band band-edge measurements.

Limits according to 15.209.

## 2.7.2 Test results

**Figure 33. Band Edge Low channel 2405 MHz. Peak detector.**

**Figure 34. Band Edge High channel 2479 MHz. Peak detector.**

The fundamental are pulsed, thus the average value is calculated by correcting the Peak detector level with the Duty Cycle Correction Factor found in section 2.1.

Channel Frequency	Detector	Band-Edge level	Margin	Limit	Result
[MHz]		[dB $\mu$ V/m]	[dB]	[dB $\mu$ V/m]	
2405	Peak	50.83	23.17	74	PASSED
2405	Average	24.22	29.78	54	PASSED
2479	Peak	64.76	9.24	74	PASSED
2479	Average	38.15	15.85	54	PASSED

Table 41. Band Edge results.

### 2.7.3 Test equipment

Description	Supplier	Model	Tag no.	Cal. due date
