ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 15C. The sample tested was found to comply with the requirements defined in the applied rules.

1 Report Summary

1.1 Report Modification Record

Alterations and additions to this report will be issued to the holders of each copy in the form of a complete document.

Issue	Description of Change	Date of Issue
1	First Issue	2018-05-15
2	Changed Applicant	2018-07-18
3	Added Exposure of Humans to RF Fields Test. (Test were be done but it was forgotten to added in the Report)	2018-08-20
4	Recalculated the MPE (SAR Limit) from Exposure of Humans to RF Fields Test.	2018-08-30
5	Recalculated the EIRP from the Exposure of Humans to RF Fields Test.	2018-09-18

2.9.4 Test Method

This test was performed in accordance with ANSI C63.10, clause 6.3, 6.4.

Measurements were made at a distance of 3 m. The limit lines shown on the plot were extrapolated from either 300 m or 30 m to the measurement distance of 3 m in accordance with ANSI C63.10 Clause 6.4.4.2.

For any emissions detected within 20 dB of the limit, a final measurement was made and recorded in the table below. The detector used for these measurements was a quasi-peak detector except for emissions within the bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where a CISPR average detector was used.

2.10.5 Test Results

Detailed results are shown below.

Exposure of Humans to RF Fields	Applicable	Declared by applicant	Measured	Exemption
The antenna is				
<input type="checkbox"/> detachable				
The conducted output power (CP in watts) is measured at the antenna connector: $CP = \dots\dots\dots \mathbf{W}$ The effective isotropic radiated power (EIRP in watts) is calculated using <input type="checkbox"/> the numerical antenna gain: $G = \dots\dots\dots$ $EIRP = G \cdot CP \Rightarrow EIRP = \dots\dots\dots \mathbf{W}$ <input type="checkbox"/> the field strength ¹ in V/m: $FS = \dots\dots\dots \mathbf{V/m}$ $EIRP = \frac{(FS \cdot D)^2}{30} \Rightarrow EIRP = \dots\dots\dots \mathbf{W}$ with: Distance between the antennas in m: $D = \dots\dots\dots \mathbf{m}$			<input type="checkbox"/>	
<input checked="" type="checkbox"/> not detachable				
A field strength measurement is used to determine the effective isotropic radiated power (EIRP in watts) given by:				

¹ The conversion formula is valid only for properly matched antennas. In other cases the transmitter output power may have to be measured by a terminated measurement when applying the exemption clauses. If an open area test site is used for field strength measurement, the effect due to the metal ground reflecting plane should be subtracted from the maximum field strength value in order to reference it to free space, before calculating TP.

$EIRP = \frac{(FS \cdot D)^2}{30} \Rightarrow EIRP = \mathbf{59.8 \text{ mW}}$				
with:				
Field strength in V/m: $FS = \mathbf{0.44}$			<input checked="" type="checkbox"/>	
Distance between the two antennas in m: $D = \mathbf{3}$			<input checked="" type="checkbox"/>	
Selection of output power				
The output power TP is the higher of the conducted or effective isotropic radiated power (e.i.r.p.):				
$TP = \mathbf{59.8 \text{ mW}}$				

Exposure of Humans to RF Fields (continued)	Applicable	Declared by applicant	Measured	Exemption
Separation distance between the user and the transmitting device is				
<input type="checkbox"/> less than or equal to 20 cm		<input type="checkbox"/>		
<input checked="" type="checkbox"/> greater than 20 cm				
Transmitting device is				
<input type="checkbox"/> in the vicinity of the human head		<input type="checkbox"/>		
<input type="checkbox"/> body-worn				

SAR evaluation										
<p>SAR evaluation is required if the separation distance between the user and/or bystander and the antenna and/or radiating element of the device is less than or equal to 20 cm, except when the device operates at or below the applicable output power level (adjusted for tune-up tolerance) for the specified separation distance defined in the table.</p> <p>For controlled use devices where the 8 W/kg for 1 gram of tissue applies, the exemption limits for routine evaluation in the table are multiplied by a factor of 5. For limb-worn devices where the 10 gram value applies, the exemption limits for routine evaluation in the table are multiplied by a factor of 2.5. If the operating frequency of the device is between two frequencies located in the table, linear interpolation shall be applied for the applicable separation distance. For test separation distance less than 5 mm, the exemption limits for a separation distance of 5 mm can be applied to determine if a routine evaluation is required.</p> <p>For medical implants devices, the exemption limit for routine evaluation is set at 1 mW. The output power of a medical implants device is defined as the higher of the conducted or e.i.r.p to determine whether the device is exempt from the SAR evaluation.</p>										
Frequency (MHz)	Exemption limits (mW) ² at separation distance of									
	≤5 mm	10 mm	15 mm	20 mm	25 mm	30 mm	35 mm	40 mm	45 mm	≥50 mm

5800	1	6	15	27	41	56	71	85	97	106

² The exemption limit in the table are based on measurements and simulations on half-wave dipole antennas at separaton distances of 5 mm to 25 mm from a flat phantom, providing a SAR value of approximately 0.4 W/kg for 1 g of tissue. For low frequencies (300 MHz to 835 MHz), the exemption limits are derived from a linear fit. For high frequencies (1900 MHz and above), the exemption limits are derived from a third order polynomial fit.

³ Transmitters operating between 3 kHz and 10 MHz, meeting the exemption from routine SAR evaluation, shall demonstrate compliance to the instantaneous limits in IC RSS-102, issue 5, section 4.

Carrier frequency: f = 902.2 MHz				
Distance: d = 20 cm				
Transmitter output power: TP = 105.61 mW				
Limit: TP_{limit} = 148.99 mW				<input checked="" type="checkbox"/>
<input type="checkbox"/> SAR evaluation is documented in test report no. ...
