### **GENERAL INFORMATION**

# **Product Description for Equipment under Test (EUT)**

| EUT Name:                         | Wireless Door/Window Sensor |
|-----------------------------------|-----------------------------|
| EUT Model:                        | SNZB-04                     |
| Operation Frequency:              | 2405-2480MHz                |
| Maximum Output Power (Conducted): | 3.75 dBm                    |
| Modulation Type:                  | OQPSK                       |
| Rated Input Voltage:              | DC 3V from battery          |
| Serial Number:                    | RDG200402007-RF-S2          |
| EUT Received Date:                | 2020.4.5                    |
| EUT Received Status:              | Good                        |

# **Objective**

This report is prepared on behalf of *Shenzhen Sonoff Technologies Co.,Ltd.* in accordance with Part 2, Subpart J, Part 15, Subparts A and C of the Federal Communications Commission's rules.

The tests were performed in order to determine the compliance of the EUT with FCC Rules Part 15-Subpart C, section 15.203, 15.205, 15.209 and 15.247 rules.

#### Related Submittal(s)/Grant(s)

No related submittal.

### **Test Methodology**

All measurements contained in this report were conducted with ANSI C63.10-2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices. And 558074 D01 15.247 Meas Guidance v05r02.

All emissions measurement was performed and Bay Area Compliance Laboratories Corp. (Dongguan).

#### **Measurement Uncertainty**

| Parameter                         | Measurement Uncertainty   |
|-----------------------------------|---|
| Occupied Channel Bandwidth        | ±5 %  |
| RF output power, conducted        | ±0.61dB   |
| Power Spectral Density, conducted | ±0.61 dB  |
| Unwanted Emissions, radiated      | 30M~200MHz: 4.55 dB,200M~1GHz: 5.92 dB,1G~6GHz: 4.98 dB,<br>6G~18GHz: 5.89 dB,18G~26.5G:5.47 dB,26.5G~40G:5.63 dB |
| Unwanted Emissions, conducted     | ±1.5 dB   |
| Temperature                       | ±1 ℃  |
| Humidity                          | ±5%   |
| DC and low frequency voltages     | ±0.4%   |
| Duty Cycle                        | 1%  |
| AC Power Lines Conducted Emission | 3.12 dB (150 kHz to 30 MHz)   |

Note: Otherwise required by the applicant or Product Regulations, Decision Rule in this report did not consider the uncertainty. The extended uncertainty given in this report is obtained by combining the standard uncertainty times the coverage factor K with the 95% confidence interval.

#### **Test Facility**

The Test site used by Bay Area Compliance Laboratories Corp. (Dongguan) to collect test data is located on the No.69 Pulongcun, Puxinhu Industry Area, Tangxia, Dongguan, Guangdong, China.

The lab has been recognized as the FCC accredited lab under the KDB 974614 D01 and is listed in the FCC Public Access Link (PAL) database, FCC Registration No.: 897218, the FCC Designation No.: CN1220.

The lab has been recognized by Innovation, Science and Economic Development Canada to test to Canadian radio equipment requirements, the CAB identifier: CN0022.

#### **Declarations**

BACL is not responsible for the authenticity of any test data provided by the applicant. Data included from the applicant that may affect test results are marked with a triangle symbol "△". Customer model name, addresses, names, trademarks etc. are not considered data.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested.

This report cannot be reproduced except in full, without prior written approval of the Company.

This report is valid only with a valid digital signature. The digital signature may be available only under the Adobe software above version 7.0.

This report must not be used by the customer to claim product certification, approval, or endorsement by A2LA, or any agency of the U.S. Government.

This report may contain data that are not covered by the accreditation scope and shall be marked with an asterisk "★".

# **SYSTEM TEST CONFIGURATION**

# **Description of Test Configuration**

The system was configured for testing in Engineering mode, which was provided by the manufacturer.

The device employs Zigbee technology, 16 channels are provided for testing:

| Channel | Frequency<br>(MHz) | Channel | Frequency<br>(MHz) |
|---------|--------------------|---------|--------------------|
| 11      | 2405               | 19      | 2445               |
| 12      | 2410               | •••     | •••                |
|         |                    |         |                    |
|         |                    |         | •••                |
|         |                    | 25      | 2475               |
| 18      | 2440               | 26      | 2480               |

EUT was tested with channel 11, 18 and 26.

#### **EUT Exercise Software**

The 'SmartRF studio 7' was used during test, which was provided by manufacturer. The maximum power level was configured by the software as below table:

| Channel | Frequency (MHz) | Power level Setting |
|---------|-----------------|---------------------|
| Low     | 2405            | 4.5                 |
| Middle  | 2440            | 4.5                 |
| High    | 2480            | 4.5                 |

The maximum duty cycle as following table:

| Ton  | $T_{on+off}$ | Duty Cycle |
|------|--------------|------------|
| (ms) | (ms)         | (%)        |
| 100  | 100          | 100        |

Date: 20.APR.2020 23:48:50

# **Equipment Modifications**

No modification was made to the EUT.

# **Block Diagram of Test Setup**

# **SUMMARY OF TEST RESULTS**

| FCC Rules                          | Description of Test                      | Result         |
|------------------------------------|--|----------------|
| §15.247 (i) & §1.1310 & §2.1091    | Maximum Permissible Exposure (MPE)       | Compliance     |
| §15.203                            | Antenna Requirement                      | Compliance     |
| §15.207 (a)                        | AC Line Conducted Emissions              | Not Applicable |
| \$15.205, \$15.209,<br>\$15.247(d) | Spurious Emissions                       | Compliance     |
| §15.247 (a)(2)                     | 6 dB Bandwidth                           | Compliance     |
| §15.247(b)(3)                      | Maximum Conducted Output Power           | Compliance     |
| §15.247(d)                         | 100 kHz Bandwidth of Frequency Band Edge | Compliance     |
| §15.247(e)                         | Power Spectral Density                   | Compliance     |

Not Applicable: This product is battery powered.

# FCC §15.247 (i) & §1.1310 & §2.1091- MAXIMUM PERMISSIBLE EXPOSURE (MPE)

#### **Applicable Standard**

According to subpart 15.247(i)and subpart §1.1310, systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

Limits for Maximum Permissible Exposure (MPE) (§1.1310, §2.1091)

| (B) Limits for General Population/Uncontrolled Exposure |                                  |                                  |                        |                          |
|---|----------------------------------|----------------------------------|------------------------|--------------------------|
| Frequency Range<br>(MHz)                                | Electric Field<br>Strength (V/m) | Magnetic Field<br>Strength (A/m) | Power Density (mW/cm²) | Averaging Time (minutes) |
| 0.3-1.34  | 614                              | 1.63                             | *(100)                 | 30                       |
| 1.34–30   | 824/f                            | 2.19/f                           | *(180/f²)              | 30                       |
| 30–300  | 27.5                             | 0.073                            | 0.2                    | 30                       |
| 300–1500  | /                                | /                                | f/1500                 | 30                       |
| 1500-100,000  | /                                | /                                | 1.0                    | 30                       |

f = frequency in MHz; \* = Plane-wave equivalent power density;

According to §1.1310 and §2.1091 RF exposure is calculated.

#### Calculation formula:

Prediction of power density at the distance of the applicable MPE limit

 $S = PG/4\pi R^2$  = power density (in appropriate units, e.g. mW/cm<sup>2</sup>);

P = power input to the antenna (in appropriate units, e.g., mW);

G = power gain of the antenna in the direction of interest relative to an isotropic radiator, the power gain factor, is normally numeric gain;

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm);

#### **Calculated Data:**

| Frequency (MHz) | Ante  | enna Gain | Conducted<br>output power<br>including Tune-<br>up Tolerance |      | Evaluation<br>Distance<br>(cm) | Power<br>Density<br>(mW/cm²) | MPE<br>Limit<br>(mW/cm²) |
|-----------------|-------|-----------|--|------|--------------------------------|------------------------------|--------------------------|
|                 | (dBi) | (numeric) | (dBm)  | (mW) |                                |                              |                          |
| 2405-2480       | 1     | 1.26      | 4  | 2.51 | 20.00                          | 0.0006                       | 1.0                      |

Result: The device meet FCC MPE at 20 cm distance

# FCC §15.203 - ANTENNA REQUIREMENT

#### **Applicable Standard**

According to § 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the user of a standard antenna jack or electrical connector is prohibited. The structure and application of the EUT were analyzed to determine compliance with section §15.203 of the rules. §15.203 state that the subject device must meet the following criteria:

- a. Antenna must be permanently attached to the unit.
- b. Antenna must use a unique type of connector to attach to the EUT.
- c. Unit must be professionally installed, and installer shall be responsible for verifying that the correct antenna is employed with the unit.

#### **Antenna Connector Construction**

The EUT has one internal antenna arrangement, fulfill the requirement of this section. Please refer to below information and the EUT photos:

| Antenna Type | input impedance<br>(Ohm) | Antenna Gain<br>/Frequency Range |
|--------------|--------------------------|----------------------------------|
| PCB          | 50                       | 1.0dBi/2.4~2.5GHz                |

Result: Compliance.

# FCC §15.209, §15.205 & §15.247(d) - SPURIOUS EMISSIONS

#### **Applicable Standard**

FCC §15.247 (d); §15.209; §15.205;

#### **EUT Setup**

#### **Below 1GHz:**

#### **Above 1GHz:**

The radiated emission Below 1GHz tests were performed in the 10 meters chamber, above 1GHz tests were performed in the 3 meters chamber B, using the setup accordance with the ANSI C63.10-2013. The specification used was the FCC 15.209, and FCC 15.247 limits.

The spacing between the peripherals was 10 cm.

#### **EMI Test Receiver & Spectrum Analyzer Setup**

The system was investigated from 30 MHz to 25 GHz.

During the radiated emission test, the EMI test receiver & Spectrum Analyzer Setup were set with the following configurations:

30MHz-1000MHz:

| Measurement | RBW     | Video B/W | IF B/W |
|-------------|---------|-----------|--------|
| QP          | 120 kHz | 300 kHz   | 120kHz |

1GHz-25GHz:

| Measurement | Duty cycle | RBW  | Video B/W |
|-------------|------------|------|-----------|
| PK          | Any        | 1MHz | 3 MHz     |
| A37         | >98%       | 1MHz | 10 Hz     |
| AV          | <98%       | 1MHz | 1/T       |

Note: T is minimum transmission duration

If the maximized peak measured value complies with under the QP/Average limit more than 6dB, then it is unnecessary to perform an QP/Average measurement.

#### **Test Procedure**

Maximizing procedure was performed on the highest emissions to ensure that the EUT complied with all installation combinations.

Data was recorded in Quasi-peak detection mode for frequency range of 30 MHz-1 GHz, peak and Average detection modes for frequencies above 1 GHz.

#### **Corrected Amplitude & Margin Calculation**

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Loss, and subtracting the Amplifier Gain from the Meter Reading. The basic equation is as follows:

Corrected Amplitude = Meter Reading + Antenna Factor + Cable Loss - Amplifier Gain

The "Margin" column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of 7dB means the emission is 7dB below the limit. The equation for margin calculation is as follows:

Margin = Limit – Corrected Amplitude

| Manufacturer             | Description       | Model                  | Serial<br>Number   | Calibration<br>Date | Calibration Due Date |
|--------------------------|-------------------|------------------------|--------------------|---------------------|----------------------|

#### Vertical

Fundamental Test with Band Rejection Filter

# FCC §15.247(a) (2)-6 dB EMISSION BANDWIDTH

#### **Applicable Standard**

According to FCC §15.247(a) (2)

Systems using digital modulation techniques may operate in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

#### **Test Procedure**

- a) Set RBW = 100 kHz.
- b) Set the video bandwidth (VBW)  $\geq 3 \times RBW$ .
- c) Detector = Peak.
- d) Trace mode =  $\max$  hold.
- e) Sweep = auto couple.
- f) Allow the trace to stabilize.
- g) Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

# FCC §15.247(b) (3) - MAXIMUM PEAK CONDUCTED OUTPUT POWER

#### **Applicable Standard**

According to FCC §15.247(b) (3), for systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

#### **Test Procedure**

- 1. Place the EUT on a bench and set it in transmitting mode.
- 2. Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to test equipment.
- 3. Add a correction factor to the display.
- 4. Set the power Meter to test Peak output power, record the result as peak power.
- 5. Set the power meter to test average output power, record the result as average power.

Page 22 of 28

Test Mode: Transmitting

Test Result: Compliant. Please refer to the following table.

| Channel | Frequency<br>(MHz) | Peak Conducted<br>Output power<br>(dBm) | Limit (dBm) |
|---------|--------------------|---|-------------|
| Low     | 2405               | 3.75                                    |             |
| Middle  | 2440               | 3.58                                    | 30          |
| High    | 2480               | 3.33                                    |             |

#### **Applicable Standard**

According to FCC§15.247(d):In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

#### **Test Procedure**

- 1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- 2. Position the EUT without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
- 3. Set RBW to 100 kHz and VBW of spectrum analyzer to 300 kHz with a convenient frequency span including 100 kHz bandwidth from band edge.
- 4. Measure the highest amplitude appearing on spectral display and set it as a reference level. Plot the graph with marking the highest point and edge frequency.
- 5. Repeat above procedures until all measured frequencies were complete.

# FCC §15.247(e) - POWER SPECTRAL DENSITY

#### **Applicable Standard**

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

#### **Test Procedure**

- 1. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- 2. Position the EUT was set without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
- 3. Set the RBW = 3 kHz, VBW = 10 kHz, Set the span to 1.5 times the DTS bandwidth.
- 4. Use the peak marker function to determine the maximum amplitude level.
