Limits for Maximum Permissible Exposure (MPE)

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (A/m)	Power Density (mW/cm²)	Averaging Time (minutes)				
(A) Limits for Occupational/Controlled Exposure								
300-1500			F/300	<6				
1500-100000			5	<6				
(B) Limits for General Population/Uncontrolled Exposure								
300-1500			F/1500	<30				
1500-100000			1	<30				

Calculation Method

Friis transmission formula: Pd=(P_{out}*G)/(4*Pi*R²)

Where:

Pd= Power density in mW/cm²

P_{out}= output power to antenna in mW

G= gain of antenna in linear scale

Pi= 3.1416

R= distance between observation point and center of the radiator in cm

Pd limit of MPE is 1mW/cm². If we know the maximum gain of the antenna and total power input to the antenna, through the calculation, we will know the distance where the MPE limit is reached.

Measurement Result

Mode	Frequency (MHz)			Tune Up Tolerance (dB)	Max. Tune Up Power (dBm)	Power Density at 20cm (mW/cm²)	Limit (mW/cm²)
Zigbee	2405	2.07	5.289	±1	6.00	0.0013	1

Note:

- 1. Calculate in the worst-case mode.
- 2. Max. Tune Up Power is declared by manufacturer, and used to calculate.
