3 Equipment under Test (EUT)

Product type: RFID Reader
Model Name: eGym RFID Board
Applicant: eGym GmbH
Manufacturer: eGym GmbH
Serial number: 2
FCC ID: 2APOCEGYMRFD01S
IC certification number: 23832-EGYMRFD01S
Application frequency band: 13.110 to 14.010 MHz
Frequency range: 13.520 to 13.597 MHz
Operating frequency: 13.560 MHz
Number of RF-channels: 1
Modulation: ASK
Antenna connector: permanent temporary none
Antenna types: PCB antenna
 detachable not detachable
Maximum antenna gain: n/a
Maximum conducted power: ---
Power supply: USB powered
nominal: 5.0 VDC \pm 5 %
Temperature range: -20°C to +50°C

3.1 Photo documentation

For external photos of the EUT see annex B, for internal ones see annex C.
For photos taken during testing and including EUT-positions see annex A.

3.2 Short description of the EUT

EUT is a RFID reader working at the frequency 13.56 MHz.

3.3 Operation mode

During the pre-tests it was observed that the “continuous-tag-reading-mode” is the respective worst- case. Therefore this mode was selected for final testing. The device was configured by manufacturer to activate the RFID reader for continuous transmission via RFID card.

The EUT was tested in 3 orthogonal positions. This is documented in annex A.

3.4 Configuration

The following peripheral devices and interface cables were connected during the tests:

Device	Model:	Serial or inventory no.
RFID Reader ¹	eGym RFID Board	2
RFID tag	13.56 MHz	----
AC power source (120 V / 60 Hz)	Chroma 616062	E00633
Power supply ²	Chromecast	S005BBV0500100
DC supply ³	Statron 3212.1	E00017
Digital multimeter ³	METRA HIT 29S	SEB00199

3.5 Used cables

Count	Description (type / lengths / remarks)	Serial no.
1	USB cable (1.5 m, shielded)	---

¹ Device was configured by the manufacturer to read the tag continuously. No PC was used for testing.

² Only representative.

³ Only used for Carrier frequency stability test.

4.4 Test procedure

1. The tests of conducted emission were carried out in a shielded room using a line impedance stabilization network (LISN) 50 μ H/50 Ohms and an EMI test receiver.
2. The EMI test receiver was connected to the LISN and set to a measurement bandwidth of 9 kHz in the frequency range from 0.15 MHz to 30 MHz.
3. The EUT was placed on a wooden table and connected to the LISN.
4. To accelerate the measurement the detector of the EMI test receiver was set to peak and the whole frequency range from 0.15 MHz to 30 MHz was scanned.
5. After that all peaks values with less margin than 10 dB to quasi-peak limit or exceeding the limit were marked and re-measured with quasi-peak detector.
6. If after that all values are under the average limit no addition measurement is necessary. In case there are still values between quasi-peak and average limit then these values were re-measured with average detector.
7. These measurements were done on all power lines.

According to ANSI C63.10, section 6.2.2 testing of intentional radiators with detachable antennas shall be done with a dummy load otherwise the tests should be done with connected antenna and if adjustable fully extended.

4.5 Test setup

Picture 1: Outline of conducted emission test setup

Comments: All peripheral devices were additionally decoupled by means of a line stabilization network.

4.6 Test results

5.3 Limits

The field strength of any emissions appearing outside of the 13.110 to 14.010 MHz band including spurious emissions falling into restricted bands as specified in 15.205(a) shall not exceed the general radiated emission limits as specified in 15.209.

Frequency [MHz]	Field strength Fs [$\mu\text{V}/\text{m}$]	Field strength [dB $\mu\text{V}/\text{m}$]	Measurement distance d [m]
0.009 – 0.490	266.6 – 4.9	48.5 – 13.8	300
0.490 – 1.705	48.98 – 14.08	33.8 – 22.97	30
1.705 – 30.0	30	29.54	30
30 – 88	100	40	3
88 – 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

As noted in 15.205(d)(7) devices according to 15.225 are exempt from complying with restricted band requirements for the 13.36 to 13.41 MHz band. Instead they have to comply with the limits as specified in 15.225 (a) to (d):

Frequency [MHz]	Field strength Fs [$\mu\text{V}/\text{m}$]	Field strength [dB $\mu\text{V}/\text{m}$]	Measurement distance d [m]
13.553 - 13.567	15,848	84	30
13.410 - 13.553	334	50.47	30
13.567 - 13.710	334	50.47	30
13.110 - 13.410	106	40.51	30
13.710 - 14.010	106	40.51	30
f < 13.110	according to limits in §15.209		
f > 14.010

5.4 Test procedure

Radiated emissions below 30 MHz

1. For emissions below 30 MHz measurements are done using a loop antenna. Prescan is performed with peak detector and final measurements with quasi-peak except for the frequency bands 9 to 90 kHz and 110 to 490 kHz where average detector applies. Antenna height is not changed during this test. Appropriate CISPR bandwidths of 200 Hz for frequencies up to 150 kHz and 9 or 10 kHz for frequencies above are used.
2. EUT is configured according to ANSI C63.10. It is placed on the top of the turntable 0.8 meter above ground. The receiving antenna is placed 3 meters from the turntable. The test setup is placed inside a fully anechoic room (called "CDC").
3. Then the EUT is rotated in a horizontal plane through 360° in steps of 45°. Starting at 0°, at each table position the spectrum for the full frequency range is recorded. If the emission at a certain frequency is higher than the levels already recorded, the current table position is noted as the maximum position
4. After the last prescan, the significant maximum emissions and their table positions are determined and collected in a list.
5. With the test receiver set to the first frequency of the list, the EUT is rotated by $\pm 45^\circ$ around the table position found during prescans while measuring the emission level continuously. For final scan, the worst-case table position is set and the maximum emission level is recorded.
6. Step 5 is repeated for all other frequencies in the list.
7. Finally, for frequencies with critical emissions the loop antenna is rotated again to find the maximum of emission.

Radiated emissions from 30 MHz to 1 GHz

1. EUT is configured according to ANSI C63.10. It was placed on the top of the turntable 0.8 meter above ground. The receiving antenna is placed 3 meters from the turntable. The test setup was placed inside a semi-anechoic chamber (SAC).
2. EUT and all peripherals are powered on.
3. The broadband antenna is set to vertical polarization.
4. The table position is set to 0°.
5. The antenna height is set to 1 m.
6. The spectrum for the full frequency range is recorded. If the emission at a certain frequency is higher than the levels already recorded, the polarization and height of the measurement antenna as well as the current table position are noted as the maximum position.
7. The antenna height is increased to 4 m in steps of 50 cm. At each height, step 6 is repeated.
8. The polarization of the measurement antenna is changed to horizontal.
9. The antenna height is decreased from 4 m to 1 m in steps of 50 cm. At each height, step 6 is repeated.
10. The EUT is rotated in a horizontal plane through 360° in steps of 60°. At each table position, steps 5 to 9 are repeated.
11. After the last prescan, the significant maximum emissions with their polarizations and heights of the measurement antenna as well as their table positions are determined and collected in a list.

Page 18 of 40

12. With the test receiver set to the first frequency of the list, the measurement antenna is set to the polarization and height and the table is moved to the position as determined during prescans.
13. The antenna is moved by ± 50 cm around this height and the EUT is rotated by $\pm 60^\circ$ around this table position while measuring the emission level continuously.
14. For final scan, the worst-case positions of antenna and table are set and the maximum emission level is recorded.
15. Steps 12 to 14 are repeated for all other frequencies in the list.

If the EUT may be used in various positions, steps 1 to 15 are repeated in two other orthogonal positions.

Tested by:	Andreas Menacher	Test date:	2018-03-22

Radiated Emission Measurement 9 kHz - 30 MHz

Recalculation factor is determined according to ANSI C63.10, section 6.4.4.2 "Extrapolation from the measurement of a single point":

$$d_{\text{near field}} = 47.77 / f_{\text{MHz}}, \text{ or}$$

$$f_{\text{MHz}} = 47.77 / d_{\text{near field}}$$

The frequency f_{MHz} at which the near field distance is equal to the limit and/or test distance is important for selection of the right formula for determining the recalculation factor:

$$f_{\text{MHz}}(300 \text{ m}) \approx 0.159 \text{ MHz}$$

$$f_{\text{MHz}}(30 \text{ m}) \approx 1.592 \text{ MHz}$$

$$f_{\text{MHz}}(3 \text{ m}) \approx 15.923 \text{ MHz}$$

For $9 \text{ kHz} \leq f \leq 159 \text{ kHz}$ and $490 \text{ kHz} < f \leq 1.592 \text{ MHz}$:

$$\text{Recalculation factor} = -40 \log(d_{\text{limit}} / d_{\text{measure}})$$

For $159 \text{ kHz} < f \leq 490 \text{ kHz}$ and $1.592 \text{ MHz} < f \leq 15.923 \text{ MHz}$:

$$\text{Recalculation factor} = -40 \log(d_{\text{near field}} / d_{\text{measure}}) - 20 \log(d_{\text{limit}} / d_{\text{near field}})$$

For $f > 15.923 \text{ MHz}$:

$$\text{Recalculation factor} = -20 \log(d_{\text{limit}} / d_{\text{measure}})$$

The limits in the graphics and value lists are derived from the general radiated emission limits as specified in 15.209 using the recalculation factor as described above.

Spectrum Mask

Test procedure

The EUT was placed in a fully anechoic chamber and the testing was performed in accordance with ANSI C63.10 and 47 CFR Part 15, section 15.225 (a) to (d). The measurement distance was 3 m. To find the closest margin of the spectrum to the limit mask adapted to the test distance the EUT was rotated by 360 degrees with detector of the test receiver set to peak. The loop antenna placed in a fixed height of 1 meter was rotated by 360 degrees to get the maximum of emission. In case of exceeding the limits the detector is switched to quasi peak for final testing in position of maximum emission.

Test result

Temperature:	20°C	Humidity:	41%
Tested by:	Andreas Menacher	Test date:	2018-03-22

Recalculation factor is determined according to ANSI C63.10, section 6.4.4.2 "Extrapolation from the measurement of a single point":

$$d_{\text{near field}} = 47.77 / f_{\text{MHz}}, \text{ or}$$

$$f_{\text{MHz}} = 47.77 / d_{\text{near field}}$$

The frequency f_{MHz} at which the near field distance is equal to the limit and/or test distance is important for selection of the right formula for determining the recalculation factor:

$$\begin{aligned} f_{\text{MHz}}(300 \text{ m}) &\approx 0.159 \text{ MHz} \\ f_{\text{MHz}}(30 \text{ m}) &\approx 1.592 \text{ MHz} \\ f_{\text{MHz}}(3 \text{ m}) &\approx 15.923 \text{ MHz} \end{aligned}$$

For $9 \text{ kHz} \leq f \leq 159 \text{ kHz}$ and $490 \text{ kHz} < f \leq 1.592 \text{ MHz}$:

$$\text{Recalculation factor} = -40 \log(d_{\text{limit}} / d_{\text{measure}})$$

For $159 \text{ kHz} < f \leq 490 \text{ kHz}$ and $1.592 \text{ MHz} < f \leq 15.923 \text{ MHz}$:

$$\text{Recalculation factor} = -40 \log(d_{\text{near field}} / d_{\text{measure}}) - 20 \log(d_{\text{limit}} / d_{\text{near field}})$$

For $f > 15.923 \text{ MHz}$:

$$\text{Recalculation factor} = -20 \log(d_{\text{limit}} / d_{\text{measure}})$$

The limits in the graphics and value lists are derived from the general radiated emission limits as specified in 15.209 using the recalculation factor as described above.

6 Radiated emission measurement (>1 GHz)

according to 47 CFR Part 15, section 15.209(a),
RSS-210, section 4.3 with RSS-Gen, section 8.9

Remark:

This measurement needs not to be applied because

- the intentional radiator operates below 10 GHz and tenth harmonic of the highest fundamental frequency is lower than 1 GHz (see 47 CFR Part 15, section 15.33(a)(1), and RSS-Gen, section 6.13), and
- the digital part of the device does not generate or use internal frequencies higher than 108 MHz (see 47 CFR Part 15 section 15.33(b)(1), and RSS-Gen, section 2.3.3 with ICES-003, section 6.2).

7.3 Limits

The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ (100 ppm) of the operating frequency over a temperature variation of -20 degrees to +50 degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C.

For battery operated equipment, the equipment tests shall be performed using a new battery. Alternatively, an external supply voltage can be used and set at the battery nominal voltage, and again at the battery operating end point voltage which must be specified by the equipment manufacturer.

7.4 Test procedure

1. If possible EUT is operating providing an unmodulated carrier. The peak detector of the spectrum analyzer is selected and resolution as well as video bandwidth are set to values appropriate to the shape of the spectrum of the EUT. The frequency counter mode of the spectrum analyzer is used to maximize the accuracy of the measured frequency tolerance.
If an unmodulated carrier is not available a significant and stable point on the spectrum is selected and the span is reduced to a value that delivers an accuracy which shall be better than 1% of the maximum frequency tolerance allowed for the carrier signal. This method may be performed as long as the margin to the frequency tolerance allowed is larger than the uncertainty of the measured frequency tolerance.
2. The carrier frequency is measured depending on the variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment an external supply voltage can be used and set at the battery nominal voltage, and again at the battery operating end point voltage which must be specified by the equipment manufacturer. Alternatively, tests shall be performed using a new battery.
3. The carrier frequency is measured over a temperature variation of -20 degrees to +50 degrees C at normal supply voltage.

Occupied bandwidth (99 %)

Test procedure

When an occupied bandwidth value is not specified in the applicable RSS, the transmitted signal bandwidth to be reported is to be its 99% emission bandwidth, as calculated or measured. The transmitter shall be operated at its maximum carrier power measured under normal test conditions.

The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts. The resolution bandwidth shall be set to as close to 1% of the selected span as is possible without being below 1%. The video bandwidth shall be set to 3 times the resolution bandwidth. Video averaging is not permitted. Where practical, a sampling detector shall be used given that a peak or peak hold may produce a wider bandwidth than actual.

The trace data points are recovered and directly summed in linear terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached and that frequency recorded. The process is repeated for the highest frequency data points. This frequency is recorded. The span between the two recorded frequencies is the occupied bandwidth. For this purpose the appropriate measurement function of the spectrum analyzer is used.

-20 dB emission bandwidth

Test procedure

Where indicated, the -20 dB emission bandwidth is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated 20 dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth equal to approximately 1.0% of the emission bandwidth.
